# Diphenyl[(phenylsulfanyl)methyl]- $\lambda^5$ -phosphanethione

### Viktoria H. Gessner

Institut fuer Anorganische Chemie, Julius-Maximilians-Universitaet Würzburg, Am Hubland, 97074 Würzburg, Germany Correspondence e-mail: vgessner@uni-wuerzburg.de

Received 21 February 2014; accepted 25 February 2014

Key indicators: single-crystal X-ray study; T = 173 K; mean  $\sigma$ (C–C) = 0.003 Å; R factor = 0.034; wR factor = 0.091; data-to-parameter ratio = 15.2.

The title compound,  $C_{19}H_{17}PS_2$ , results from the direct deprotonation of diphenylmethylphosphine sulfide and subsequent reaction with diphenyl disulfide. The C–P and C–S bond lengths of 1.8242 (18) and 1.8009 (18) Å, respectively, of the central P–C–S linkage are comparable to those found in the sulfonyl analogue, but are considerably longer than those reported for the dimetallated sulfonyl compound. The dihedral angle between the benzene rings of the diphenylmethyl moiety is 69.46 (7)°. No distinct intermolecular interactions are present in the crystal structure.

# Viktoria H. Gessner

# S1. Comment

Methylene compounds with two anion-stabilizing substituents, such as phosphonium or sulfonyl moieties, have found special interest as precursors for the corresponding dimetallated methandiides (Kasani *et al.*, 1999; Ong *et al.*, 1999; Cantat *et al.*, 2006; Cooper *et al.*, 2010). These dianions were found to be excellent ligands for the preparation of carbene complexes exhibiting a unique electronic structure (Gessner *et al.*, 2013). They allowed the synthesis of a variety of different complexes with early and late transition metals, but also with lanthanides and actinides (Cavell *et al.*, 2001; Cantat *et al.*, 2008; Harder, 2011; Liddle *et al.*, 2011).

As part of our studies on the synthesis of novel methandiides for the preparation of carbene complexes, we have developed a ligand and its dianionic analogue with a thiophosphoryl and sulfonyl sidearm (Schröter & Gessner, 2012). Thereby, the synthesis of a protonated precursor is best achieved *via* a two-step synthesis, with the first step being the lithiation of diphenylmethylphosphine sulfide and its reaction with diphenyl disulfide (Becker & Gessner, 2014*a*,*b*). This procedure furnishes the title compound,  $C_{19}H_{17}PS_2$ , in good yield. Oxidation of the sulfide to the sulfone gives way to the final ligand (Gessner, 2012).

The bond lengths and angles in the title compound are comparable to the sulfonyl analogue, but deviate considerably from the dimetallated compound (Schröter & Gessner, 2012). These differences are most pronounced in the P—C—S backbone. While the title compound features C—P and C—S distances of 1.8242 (18) and 1.8009 (18) Å, respectively, the sulfonyl substituted dianion shows C—P<sub>av</sub> distances shortened by  $\approx 7\%$  [1.710 (4) Å] and C—S distances shortened by  $\approx 11\%$  [1.614 (3) Å] (Schröter & Gessner, 2012). Additionally, the P—C—S angle experiences a widening from 107.7 (1)° in the title compound to 121.4 (2)° in the methandiide. This is the result of a change in the hybridization of the central carbon atom from  $sp^3$  in the title compound to  $sp^2$  in the methandiide.

No distinct intermolecular interactions (such as C—H···S interactions) are present in the crystal structure of the title compound.

# **S2. Experimental**

4.00 g (17.2 mmol) diphenylmethylphosphane sulfide were dissolved in 50 ml THF and 11.1 ml (17.2 mmol) *n*-butyllithium (1.55 *M* solution in hexane) were added drop-wise at 195 K. The mixture was allowed to warm to room temperatureand stirred for additional 3 h. After cooling to 195 K 3.76 g (17.2 mmol) diphenyldisulfide dissolved in 30 ml THF were added. The mixture was stirred overnight, quenchedby the addition of 50 ml water and extracted three times with 40 ml diethyl ether. After drying over sodium sulfate, the solvent was removed *in vacuo* and the residue purified by bulb-to-bulb distillation (oven temperature 473–483 K, 1x10<sup>-3</sup> mbar). The title compound was obtained as a yellowish oil, which solidified after a couple of days (4.21 g, 12.3 mmol; 72%). <sup>1</sup>H NMR: (300.1 MHz, CDCl<sub>3</sub>):  $\delta$  =3.92 (d, <sup>2</sup>*J*<sub>PH</sub> = 9.09 Hz, 2H; PC*H*<sub>2</sub>S),7.16–7.19 (m, 3H; C*H*<sub>SPh,meta/para</sub>), 7.23–7.27 (m, 2H; C*H*<sub>SPh,ortho</sub>),7.40–7.47 (m, 6H; C*H*<sub>PPh,meta/para</sub>), 7.72– 7.79 (m, 4H; C*H*<sub>PPh,ortho</sub>).<sup>13</sup>C {<sup>1</sup>H} NMR: (75.5 MHz, CDCl<sub>3</sub>):  $\delta$  = 38.5 (d, <sup>1</sup>*J*<sub>PC</sub> =52.25 Hz; PCH<sub>2</sub>S), 127.1 (*C*<sub>SPh,ortho</sub>), 128.6(d,  ${}^{3}J_{PC} = 12.33 \text{ Hz}$ ;  $C_{PPh,meta}$ ),129.0 ( $C_{SPh,meta}$ ), 130.4 ( $C_{SPh,para}$ ), 131.0(d,  ${}_{1}J_{PC} = 82.59 \text{ Hz}$ ;  $C_{PPh,ipso}$ ),131.6 (d,  ${}^{4}J_{PC} = 10.24 \text{ Hz}$ ;  $C_{PPh,ortho}$ ),131.9 (d,  ${}^{3}J_{PC} = 2.90 \text{ Hz}$ ,  $C_{PPh,para}$ ),135.5 (d,  ${}^{2}J_{PC} = 5.78 \text{ Hz}$ ;  $C_{SPh,ipso}$ ). ${}^{31}P{}^{1}H$  NMR: (122.0 MHz, CDCl<sub>3</sub>):  $\delta =$ 40.6. # **S3. Refinement**

The H atoms were refined on a riding model approximation in their ideal geometric positions with C—H = 0.95 Å for C– H(aromatic) and 0.99 for CH<sub>2</sub> atoms, respectively, with  $U_{iso}(H) = 1.2U_{eq}(C)$ .

# Special details

**Geometry**. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement**. Refinement of  $F^2$  against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on  $F^2$ , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on  $F^2$  are statistically about twice as large as those based on *F*, and *R*-factors based on ALL data will be even larger.
