#### **Short title**

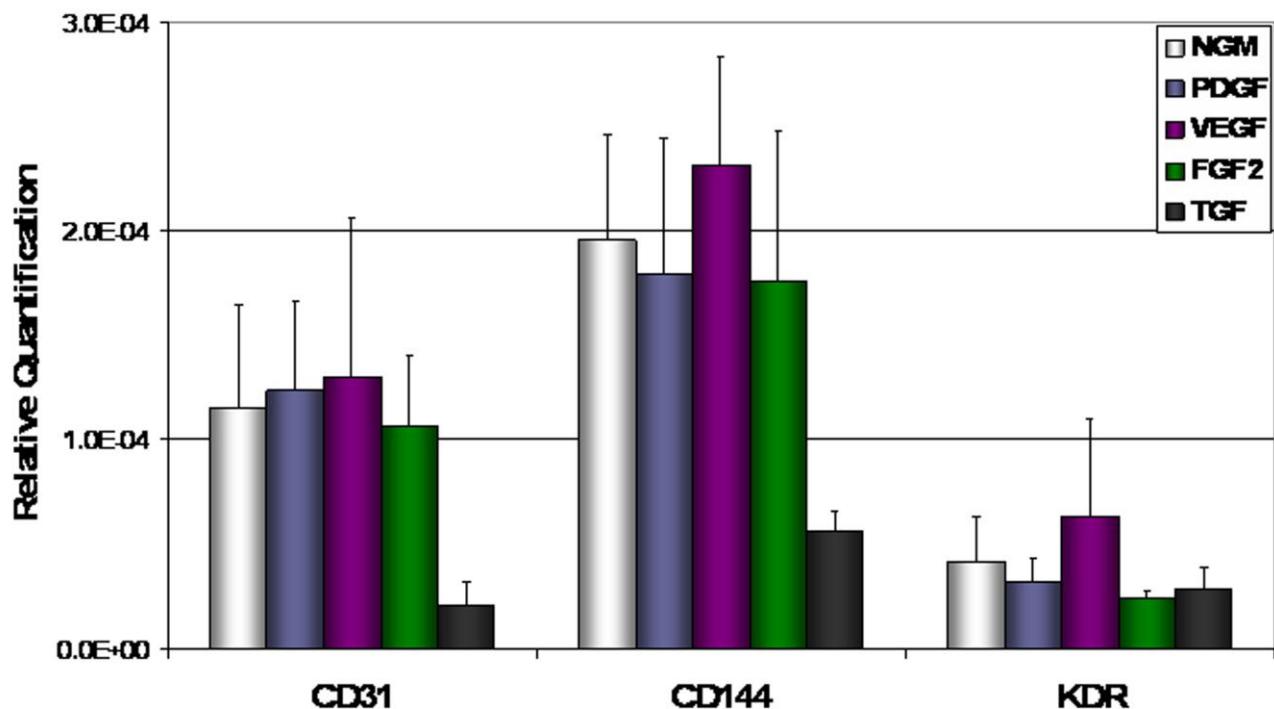

HOX code in vascular wall-resident CD44+ multipotent stem cells

## Supplementary Figure S1

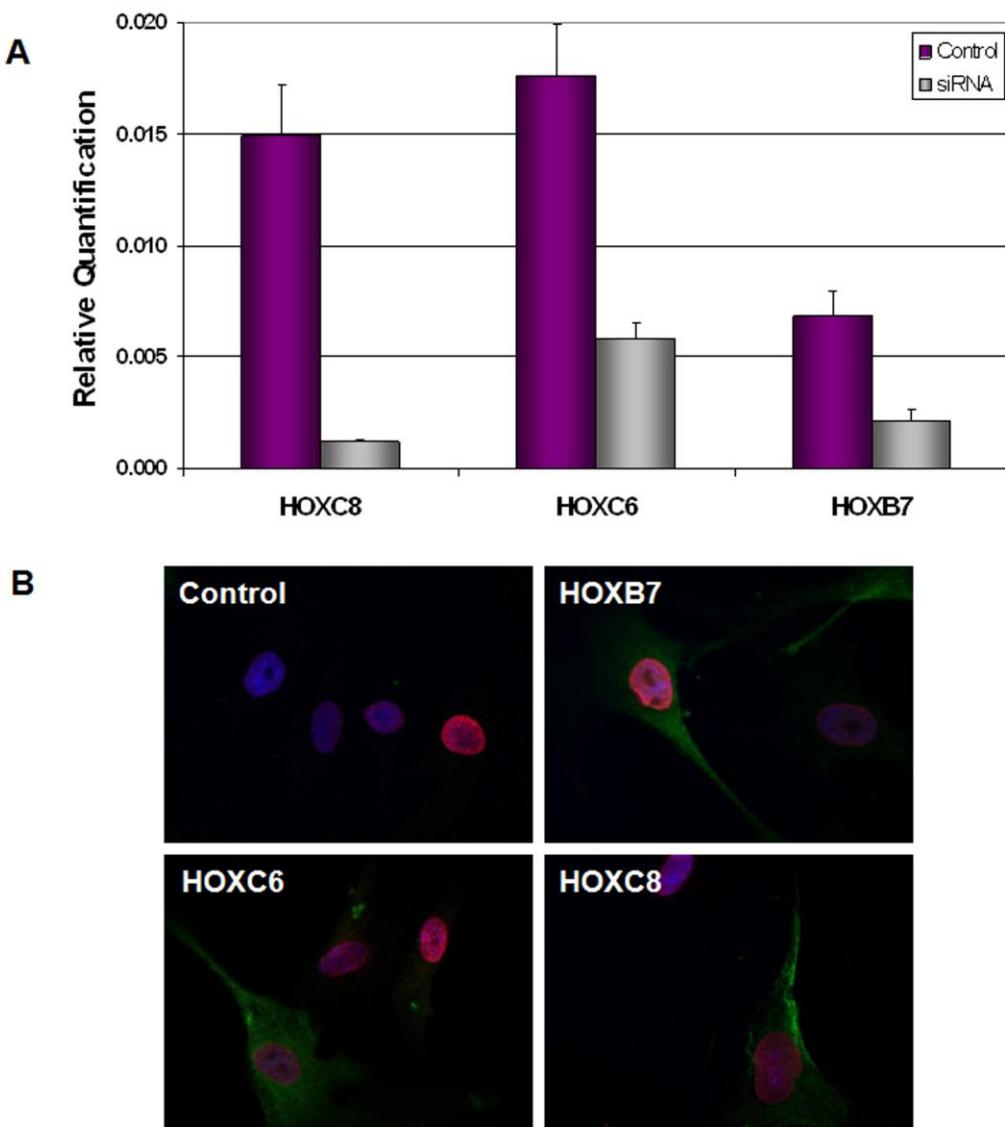

**Supplementary Figure S1 | Analysis of endothelial marker gene expression in human vascular wall-resident multipotent stem cells.** Real-Time RT-PCR quantification of well known endothelial gene mRNA expression in VW-MSCs (MSC, purple bars) as compared to human embryonic stem cells (ES, blue bars), aortic smooth muscle cells (SMC, dark blue bars), human umbilical cord endothelial cells (HUVEC, white bars) and freshly isolated endothelial cells from hITA fragments (hITAEC, grey bars) using specific primers for KDR/VEGFR2, CD34, CD31/PECAM1, CD144/VE-Cadherin and CD146/MCAM. Resulting expression levels were normalized by division through the mean expression value of the reference gene (beta actin) and are shown as relative quantification units (RQ). Data are presented as mean  $\pm$  SD from three independent experiments measured two times each.

## Supplementary Figure S2

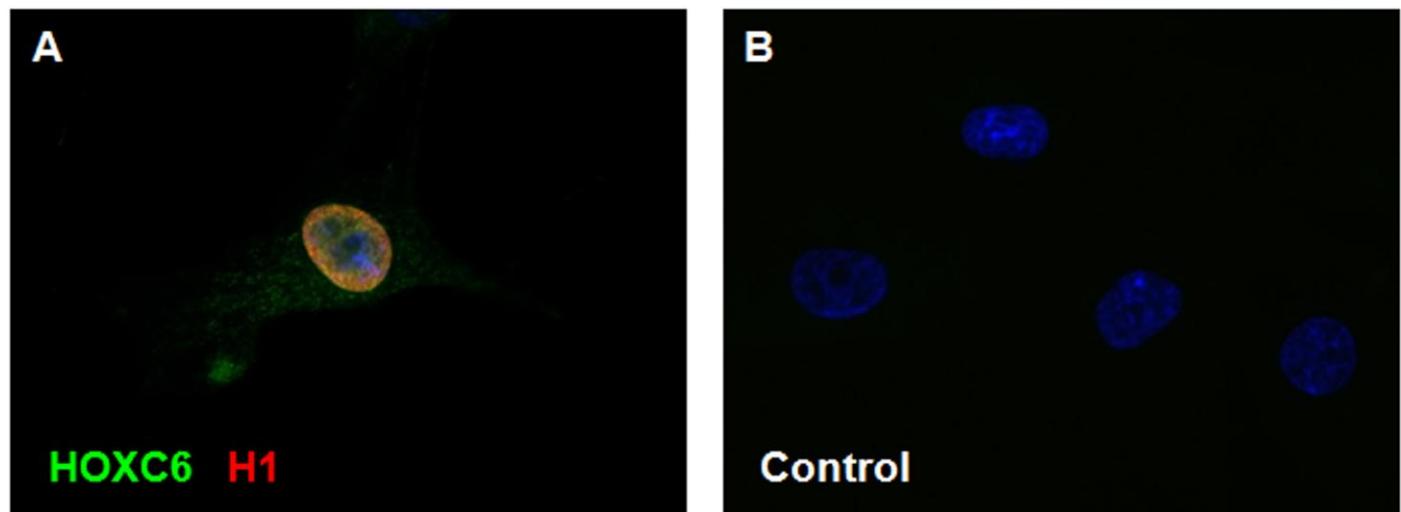

**Supplementary Figure S2 | Exogenous growth factor treatment induces no endothelial cell differentiation of cultured vascular wall-derived MPSCs.** VW-MPSCs cultured in normal growth media (NGM) supplemented with VEGF165, PDGF-BB, FGF2 (10ng/ml) and TGF $\beta$ 1 (5ng/ml) for 14 days show no increase in the endothelial marker gene expression (CD31/PECAM1, CD144/VE-Cadherin, KDR/VEGFR2) indicating that the cells were not able to differentiate into the endothelial lineage. Data are presented as mean  $\pm$  SEM from 3 independent experiments performed in duplicates each

### Supplementary Figure S3

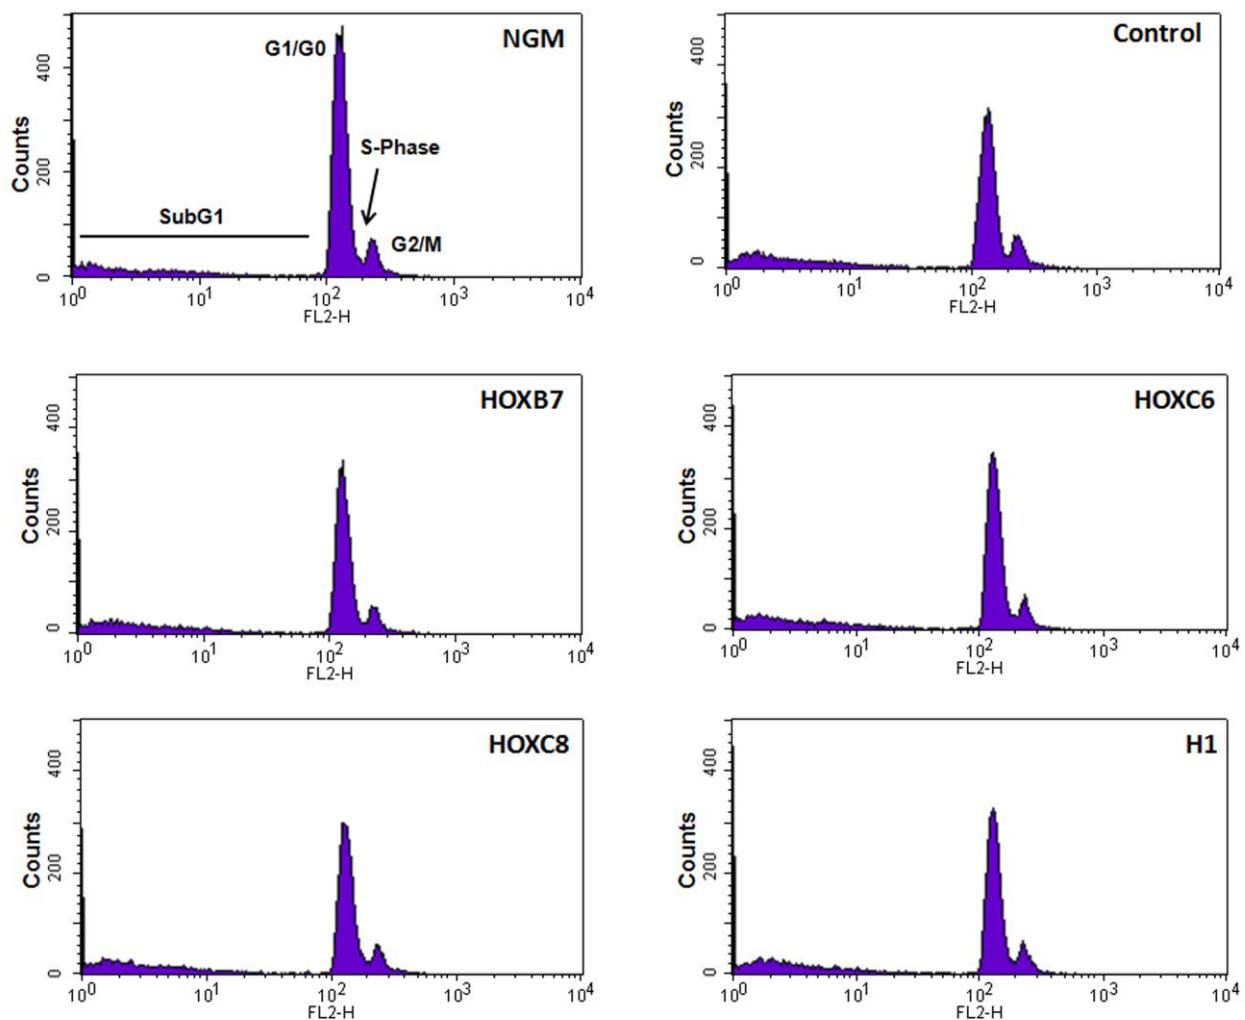

**Supplementary Figure S3 | Silencing over-expressed HOX genes in cultured vascular wall-derived.** VW-derived MPSCs were transfected with Control (non-silencing) or HOXC8, HOXC6, HOXB7 siRNA alone or in indicated combinations. After 4 days cells were harvested and subjected for mRNA isolation and Real-Time RT-PCR quantification of HOX gene silencing (A). Resulting expression levels of were normalized by division through the mean expression value of the reference gene (Actin) and are shown as relative quantification units (RQ). Data are presented as mean  $\pm$  SEM from 4 independent experiments performed in duplicates each. \*\* p  $\leq$  0.005. Immunofluorescence analysis of H1 (red) and TAGLN (green) demonstrated an up regulation of TAGLN expression and partially of H1 upon HOX silencing (B).

## Supplementary Figure S4

**Supplementary Figure S4 | Silencing over-expressed HOX genes in cultured vascular wall-derived.** Immunofluorescence analysis of H1 (red) and HOXC6 (green) demonstrated co-localization of both proteins in the nucleus. For control staining isotype controls were used.

## Supplementary Figure S5

**Supplementary Figure S5 | Cell cycle analysis after silencing over-expressed HOX genes in cultured vascular wall-derived.** VW-derived MPSCs were transfected with Control (non-silencing) or HOXC8, HOXC6, HOXB7 siRNA alone or in indicated combinations and subjected for Nicoletti staining. Two-color flow cytometric analysis was used to determine cells actively synthesizing DNA and their position in G0/1, S, G2/M phase of the cell cycle. Representative graph for three independent experiments are shown.

### Explanations

Upper row Original sequence

Lower row Bisulfite modified sequence

++ CpG sites (for display, assume all CpG sites are methylated)

:: Non-CpG 'C' converted to 'T'

**TATA box (at position 368)**

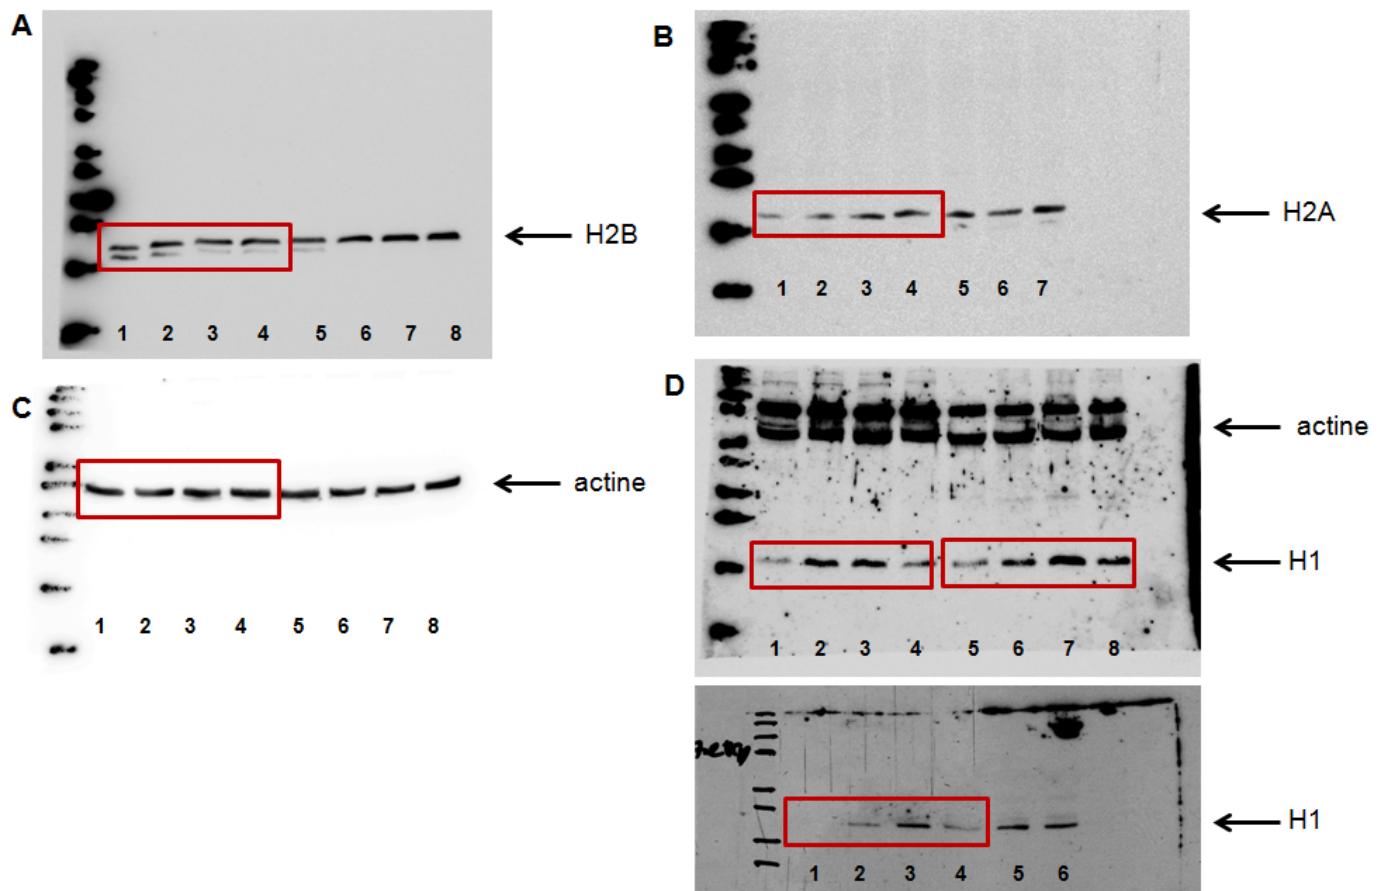

Promotor start at position 500

**Supplementary Figure S6 | Bisulfite Conversion of predicted TAGLN promoter sequence.**  
The human gene transgelin TAGLN (ENSG00000149591; Chromosome 11: 117,070,037-117,075,503 forward strand) was analyzed for promoter prediction sites using the Promotor 2.0 prediction server ([www.cbs.dtu.dk/services/Promoter/](http://www.cbs.dtu.dk/services/Promoter/)) and SoftBerry NSITE (<http://linux1.softberry.com>). Predicted TATA box (at position 368) and the predicted promoter start region (at position 500) were emphasized. Bisulfite modified sequence was generated using the program MethPrimer (<http://www.urogene.org/methprimer/index1.htm>).

## Supplementary Information

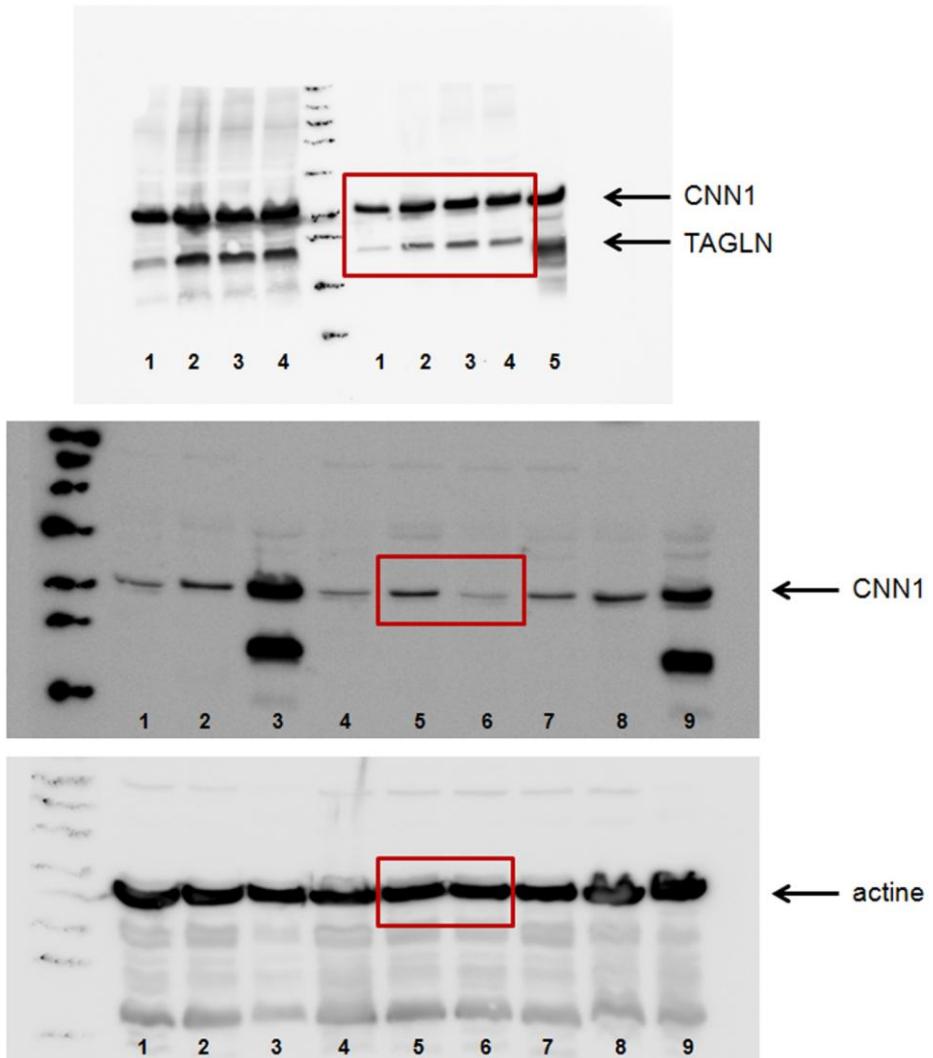

### Full Gels

#### Supplementary Figure S7

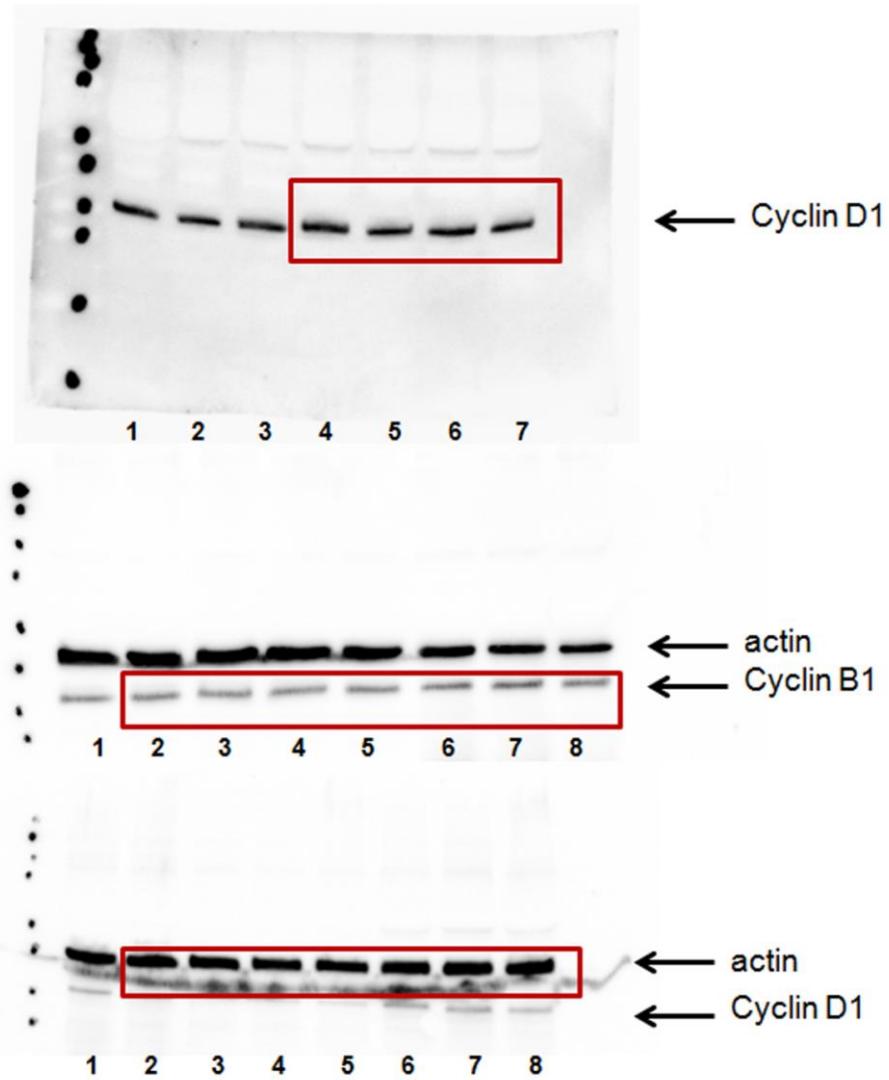

**Supplementary Figure S7 | Full gels of cropped gels (emphasized by a red rectangle) as shown in Figure 4B.** Histone H1, H2B, H2A protein levels were detected by Western blot. Equal protein amounts (50 µg, whole cell lysate) were loaded. Beta-actin was included as a loading control. (A-C) Lanes: 1 Control, 2 HOXC8, 3 HOXC6, 4 HOXB7, 5 Control, 6 HOXC8, 7 HOXC6, 8 HOXB7 of a different experiment; (D) Lanes: upper panel 1 Control, 2 HOXC8, 3 HOXC6, 4 HOXB7, 5 Control, 6 HOXC6/B7, 7HOXC8/B7, 8 HOXC8/C6/B7; lower panel 1 Control, 2 HOXC8, 3 HOXC6, 4 HOXB7, 5 HOXC6/B7, 6 HOXC8/B7.

### Supplementary Figure S8

**Supplementary Figure S8 | Full gels of cropped gels (emphasized by a red rectangle) as shown in Figure 5B, D.** TAGLN, CNN1 and H1 protein levels were detected by Western blot. Equal protein amounts (50 µg, whole cell lysate) were loaded. (upper panel) Lanes: 1 Control, 2 HOXC8, 3 HOXC6, 4 HOXB7 of two independent experiments, 5 control lysate (human aortic smooth muscle cells, hAoSMC); (lower panels) Control, 6 HOXC8, 7 HOXC6, 8 HOXB7 of a different experiment; (D) Lanes: 1 H1, 2 Control, 3 hAoSMC, 4 H1, 5 Control, 6 H1, 7 H1, 8 NGM, 9 hAoSMC. Beta-actin was included as a loading control using the same membranes.

**Supplementary Figure S9**

**Supplementary Figure S9 | Full gels of cropped gels (emphasized by a red rectangle) as shown in Figure 6B.** Cyclin D1 and B1 protein levels were detected by Western blot. Equal protein amounts (50 µg, whole cell lysate) were loaded. (upper panel) Lanes: 1 NGM, 2 Control, 3 NGM, 4 Control 5 HOXB7, 6 HOXC6, 7 HOXC8; (lower panels) Lanes: 1 NGM, 2 Control, 3 HOXB7, 4 HOXC6, 5 HOXC8, 6 HOXB7/HOXC6, 7 HOXB7/HOXC6/HOXC8, 8 NGM. Beta-actin was included as a loading control using the same membranes.

Specific primers were synthesized based on available sequences for each listened gene. Primer design was done with the program Primer 3 ([http://frodo.wi.mit.edu/cgi-bin/primer3/primer3\\_www.cgi](http://frodo.wi.mit.edu/cgi-bin/primer3/primer3_www.cgi)). Cross-reaction of primers with the genes was excluded by comparison of the sequence of interest with a database (Blast 2.2, U.S. National Centre for Biotechnology Information, Bethesda, MD, USA) and all primers used in our study were intron-spanning. PCR products are 300-400 bp in size.

**Supplementary Table S2**  
**QRT-PCR analysis of HOX gene expression levels**

Real-Time RT-PCR quantification of HOX gene expression levels in VW-MPSCs as compared to human embryonic stem cells (hES), human aortic smooth muscle cells (hAoSMC) and human umbilical cord endothelial cells (HUVEC). was done using specific primers synthesized based on available sequences for HOX family members. Obtained expression levels were normalized by division through the mean expression value of the reference gene (Actin) and are shown as relative quantification units (RQ). Data are presented as mean ± SD from four (MSC), three (human ES), four (SMC), three (HUVEC) and two (EC) independent experiments measured two times each.

**Supplementary Table S3**  
**HOX target genes**

For each probe set three (control, HOXC6, HOXB7) and two (HOXC8) Affymetrix® DNA chips were used. Upon siRNA treatment expression of 1666 genes were significantly affected by HOXC8 gene silencing, 1609 genes by HOXC6 and 2075 genes by silencing HOXB7. Comparing all three target genes, gene expression of 373 genes was significantly altered: 172 genes were up-regulated and 201 genes were down-regulated as compared to control VW-MPSCs.
