## 1 Introduction

Within organic chemistry, the synthesis of natural products has been a stimulus for the development of new and selective preparative methods for many decades, ${ }^{1}$ and these methods have found manifold use in countless industrial processes of high economic interest and revenue. Within the field of medicinal chemistry, these methods are being used to prepare libraries of thousands of structural variations of pharmacologically more or less useful compounds, only about one or two out of ten thousand of which finds its way through pre-clinical and clinical testing to become a new medicine ingredient, which means enormous research and development (R\&D) costs. ${ }^{2}$

At this very point, the concept of sila-substitution of such pharmacologically active compounds (i.e., the exchange of one or more selected carbon atom(s) at specific positions of the parent carbon-based drug) comes into play. ${ }^{3,4}$ By application of this concept, which has been developed by our group for decades ${ }^{5}$ (and still is being developed further), to a prevailing compound of such traditional pre-clinical and clinical testing processes, there is an opportunity to improve the properties of a drug even further without synthesizing large numbers of compounds. Still, almost all the experience of those traditional processes which have lead to the specific molecular shape of the parent carbon compound flows into the development of its silicon derivative, since the organic side chains remain untouched, providing the conclusion that the concept of silasubstitution of drugs offers the opportunity to obtain economically profitable drugs on a costeffective and short time scale.

Among the properties of a drug which can be influenced by a C/Si exchange are not only its pharmacodynamics, but also its ADMET properties, i.e., its absorption into, distribution and metabolism in, excretion from, and toxicology within a biological system like the human body; hence, there are numerous parameters to be addressed.

Some of the most prominent and successful examples of a $\mathrm{C} / \mathrm{Si}$ switch are the silanols rac-hexahydro-sila-difenidol (rac-HHSiD) (rac-1) and rac-p-fluoro-hexahydro-sila-difenidol (rac-p-FHHSiD) (rac-2), ${ }^{6}$ which have excellent functional muscarinc $\mathrm{M}_{3}$ receptor subtype selectivity and therefore are in use as commercially available pharmacological tools for the characterization of muscarinic receptor subtypes, whereas our group's most recent developments in the field of siliconbased drugs include the silanols $\left(\mathrm{C}_{3} \mathrm{COH} / \mathrm{C}_{3} \mathrm{SiOH}\right.$ exchange) rac-sila-fexofenadine (rac-3) ${ }^{7}$ and sila-haloperidol (4) ${ }^{8}$ as well as compounds with a $\mathrm{C}_{4} \mathrm{Si}$ backbone ( $\mathrm{C}_{4} \mathrm{C}^{2} \mathrm{C}_{4} \mathrm{Si}$ exchange), e.g., rac-sila-niguldipine (rac-5) ${ }^{9}$ and a series of $\sigma$ ligands (6-9) ${ }^{10}$. In addition, the C/Si exchange concept was extended to the substitution of quaternary formally positively charged ammonium nitrogen atoms for electrostatically neutral silicon atoms ( $\mathrm{N}^{+} /$Si exchange) (prototype: compound 10), which
resulted in a tremendous change of the allosteric action of $\mathbf{1 0}$ compared to its parent alkanediaminium compound, the allosteric modulator W84 (11): ${ }^{11,12}$ Whereas $\mathbf{1 1}$ decreased equilibrium binding of the orthosteric ligand $\left[{ }^{3} \mathrm{H}\right] N$-methylscopolamine ( $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ ) at muscarinic $\mathrm{M}_{2}$ receptors (negative cooperativity), $\mathbf{1 0}$ significantly enhanced $\left[{ }^{3} \mathrm{H}\right]$ NMS binding (positive cooperativity). ${ }^{13,14}$

Although parts of the syntheses of these silicon compounds can be accomplished by the application of known methods, the aim to prepare them stimulates chemists to develop new methods, as the synthesis of natural products does in organic chemistry, or leads to unexpected observations. This actually happened to be, for instance, in the case of sila-haloperidol, where an unexpected ease of the hydrolytic cleavage of sila-haloperidol disiloxane was observed. ${ }^{8 b}$

## 2 Aim

Within the frame of aiming at the synthesis of specific target structures which represent silaanalogs of biologically active molecules, these targets were to be used as a stimulus to search for novel and unconventional methods wherever the opportunity to do so would present itself, which parallels the role of the synthesis of natural products as a stimulus for method development in organic chemistry (cf. Section 1).

In continuation of our studies on the concept of sila-substitution of biologically active compounds, this concept was to be applied on a spectrum of targets including a carbinol/silanol $\left(\mathrm{C}_{3} \mathrm{COH} / \mathrm{C}_{3} \mathrm{SiOH}\right)$ exchange, the exchange of quaternary carbon atoms for silicon atoms $\left(\mathrm{C}_{4} \mathrm{C} / \mathrm{C}_{4} \mathrm{Si}\right.$ exchange), and the exchange of formally positively charged nitrogen atoms for electrostatically neutral silicon atoms $\left(\mathrm{C}_{4} \mathrm{~N}^{+} / \mathrm{C}_{4} \mathrm{Si}\right.$ exchange). In cases where interesting biological data was obtained for the resulting silicon compounds, scale-up was to be included in this work up to a scale of tens of grams. In addition, the studies on carbinol/silanol switches lead to the development of the $\mathrm{Si}-2,4,6$ trimethoxyphenyl group as a novel protecting group in organosilicon chemistry, which was found to be extremely useful for the preparation of functionalized (chloromethyl)silanes; therefore, several compounds of this type were included as preparative targets. These aims are presented in detail in the following sections.

### 2.1 Sila-venlafaxine

Racemic venlafaxine hydrochloride ( $\mathrm{rac} \mathbf{- 1 2 a} \cdot \mathrm{HCl}$ ) (Effexor ${ }^{\text {TM }}$, Wyeth-Ayerst; Efexor ${ }^{\text {TM }}$, Wyeth, Wyeth-Lederle; Trevilor ${ }^{\text {TM }}$, Wyeth) is a serotonin/noradrenaline reuptake inhibitor ${ }^{15}$ which is in clinical use as an antidepressant. ${ }^{16}$

Its silicon derivative sila-venlafaxine (rac-12b) was chosen as a target since sila-substitution of rac-12a ( $\rightarrow$ rac-12b) was expected to affect the chemical and physicochemical properties and the structure of rac-12a and therefore to alter its biological properties. For example, (i) the higher OH acidity of silanols (compared to analogous carbinols) should increase the strength of hydrogenbonding interactions with biomolecules (receptors) and thus should enhance receptor binding. (ii) As the covalent radius of silicon is larger than that of carbon, the $\mathrm{C} / \mathrm{Si}$ analogs rac-12a and rac-12b
are expected to differ in their structure (size and shape) and in their stereodynamics, which may also affect receptor binding. (iii) Furthermore, differences in the lipophilicity of rac-12a and rac-12b can be assumed, which could alter the ADMET properties.

Once methods for the preparation of $\mathbf{r a c - 1 2 b}$ have been established, the resolution of racemic sila-venlafaxine (rac-12b) was to be accomplished including the determination of the absolute configuration of the sila-venlafaxine enantiomers $(R) \mathbf{- 1 2 b}$ and $(S) \mathbf{- 1 2 b}$. All these compounds (rac$\mathbf{1 2 b},(R) \mathbf{- 1 2 b}$, and $(S) \mathbf{- 1 2 b})$ were to be prepared as pharmacologically acceptable salts, preferably as the hydrochlorides, and to be compared to their parent carbon compounds rac-12a, ( $R$ ) -12a, and $(S)-\mathbf{1 2 a}{ }^{17}$ concerning their pharmacological profile (i.e., reuptake inhibition of serotonin, noradrenaline, and dopamine). In addition, the methods for the preparation of $\mathbf{r a c - 1 2 b},(R) \mathbf{- 1 2 b}$, and $(S)$-12b were to be planned and chosen concerning heat flow, gas flow, toxicity, safety, and ecological and economical aspects in order to facilitate scale-up on a multi-kilogram scale. ${ }^{18}$

### 2.1.1 Derivatives of sila-venlafaxine

Studies on the structure-activity relationships (SARs) of carbon-based venlafaxine derivatives have shown that the receptor affinities crucially depended on (i) the substituents attached to the nitrogen atom, with other patterns apart from the dimethylamino group leading to a detrimental effect on the biological activity in most cases, (ii) the size of the cycloalkanol ring, with the highest affinities being observed for five- and six-membered ring systems, and (iii) the substituents attached to the phenyl group, with the highest affinities being observed for $4-\mathrm{OMe}, 4-\mathrm{OH}, 4-\mathrm{Cl}$, and $4-\mathrm{Br}$ substituents.

Hence, to get further insight into the structure-activity relationships of silicon-based silavenlafaxine derivatives, rac-13-rac-15 were chosen as target compounds for several reasons. (i) The amino moiety was chosen to be dimethylamino in all cases, since an entirely detrimental effect on the biological activity of the silicon-based venlafaxine derivatives was to be avoided. (ii) The most interesting question was what influence variation of the 1 -silacycloalkan-1-ol ring size would have, since, due to the larger covalent radius of silicon compared to that of carbon, the maximum receptor affinity may shift from the six- and five-membered ring systems in the case of carbon to the five- and four-membered ring systems rac-13 and rac-14 in the case of silicon. In addition, compound rac- $\mathbf{1 4}$ was of special interest since the strain of the four-membered ring system was expected to influence the acidity of the OH group significantly. (iii) The $4-\mathrm{H}$ derivative rac- $\mathbf{1 5}$ was chosen as a target for a negative crosscheck. Since the absence of any substituent in the 4-position of the phenyl group lead to a lower receptor affinity in the SAR of the parent carbon-based venlafaxine derivatives, rac-15 presented itself for a crosscheck to see if the corresponding silicon derivatives would follow similar SARs.

rac-14

rac-15

### 2.1.2 Prodrugs of sila-venlafaxine

Silanols can be formed easily by hydrolysis of halosilanes, alkoxysilanes, aminosilanes, and hydridosilanes under the conditions of an in vivo environment. ${ }^{5,19}$ This chemistry, which is intrinsic to silicon, but not to carbon, offers the possibility to use these non-enzymatic hydrolysis reactions in vivo when a prodrug of a silanol is applied to an organism. Hence, the sila-venlafaxine prodrugs rac-16-rac-18 were additional targets.

rac-16

rac-17

rac-18

The hydrolysis reactions of rac-16, rac-17, and rac-18 are bioactivation processes with respect to the biological activity of rac -sila-venlafaxine (rac-12b). However, it should be noted that venlafaxine (12a) was developed by hybridizing the molecular shapes of the mixed opiate agonistantagonist ciramadol (19) and of the antidepressant rac-gamfexine (rac-20). ${ }^{15 \mathrm{c}}$ The close structural analogy of rac-18 and rac-20 suggests that, if rac-18 should have similar efficacies like racgamfexine (rac-20) in vivo, an interesting change in the pharmacological action of rac-18 can be expected in vivo over a certain time scale, since the hydrolysis reaction rac-18 $\rightarrow$ rac-12b would then mean a simultaneous bioinactivation of the gamfexine-like action and a bioactivation of the sila-venlafaxine action.

Ciramadol (19)

rac-Gamfexine (rac-20)

### 2.2 Disila-bexarotene

Bexarotene (Targretin ${ }^{\mathrm{TM}}, \mathbf{2 1 a}$ ) is an RXR-selective retinoid that is in therapeutic use for treatment of cutaneous T-cell lymphoma. ${ }^{20-23}$ As almost all sila-analogs of drugs studied so far are
antagonists, ${ }^{5}$ the twofold sila-substitution of the retinoid agonist bexarotene was particularly challenging.

The molecular events by which RXR and other members of the nuclear receptor family regulate transcription of cognate gene programs are, at least in principle, reasonably well understood. ${ }^{24}$ The signalling cascade relies on a precisely orchestrated recruitment and dissociation of transcription factors and molecular machineries to target gene promoters, which is initiated upon ligand binding. Multiple transcription activation, protein interaction, and crystallographic studies have revealed structural features of nuclear receptor ligand binding domains that are generated upon binding of agonists, antagonists, mixed agonists/antagonists, or inverse agonists, demonstrating an unexpected potential to modulate nuclear receptor action by ligand design. ${ }^{25}$ Here we explore for the first time the activity of a ligand with a silicon-containing backbone.

Due to the different covalent radii of carbon and silicon, disila-substitution of the tetrahydronaphthalene skeleton of bexarotene was expected to change the structure (conformation) of the saturated ring and also to increase the lipophilicity (in this context, see ref. 5). This effect was expected to be more pronounced in the case of disila-bexarotene (21b) than in the case of silavenlafaxine (12b) since four $\mathrm{Si}-\mathrm{C}$ bonds are present in the six-membered ring system of 21b after a twofold $\mathrm{C} / \mathrm{Si}$ exchange. This point is underlined by the following estimation: Usual bond lengths are $1.54 \AA\left(\mathrm{C}-\mathrm{C}\right.$ bond) and $1.87 \AA\left(\mathrm{Si}-\mathrm{C}\right.$ bond). ${ }^{26}$ With four $\mathrm{Si}-\mathrm{C}$ bonds being present within the saturated ring of 21b, this difference should cause an enlargement of approximately $4 \times(1.87-1.54) \AA=1.32 \AA$, which nearly equals an additional $\mathrm{C}-\mathrm{C}$ bond within this ring system. As a result, the molecular shape of 21b should be similar to a carbon-based seven-membered ring system, and, therefore, disila-bexarotene (21b) makes a highly interesting target for testing its biological retinoid agonist activity. Finally, as carbon and silicon differ in their electronegativity, differences in the electronic properties (electrostatic potential) have also to be considered. All these changes could lead to different biological properties of the $\mathrm{C} / \mathrm{Si}$ analogs 21a and 21b.

The aim of the present work was to synthesize reasonable amounts of $\mathbf{2 1 b}{ }^{27}$ to be used in biological studies on the C/Si pair 21a/21b including in vitro studies (ligand binding to RXR receptors and RXR activation) as well as in vivo studies.

### 2.3 Disila-AG-045572 (disila-CMPD1)

While peptide-type gonadotropin-releasing hormone (GnRH) antagonists and agonists are already in clinical use for the treatment of reproductive disorders and steroid hormone-dependent tumors, nonpeptide-type GnRH antagonists have appeared in the literature very recently, and several advantages over peptide-type GnRH agonists and antagonists have been discussed. ${ }^{28}$ AG045572 (CMPD1, 22a) is a very recent example of a potent orally active nonpeptide GnRH antagonist. ${ }^{29,30}$ The sila-substitution approach was applied to 22a with the aim to optimize the pharmacodynamic and pharmacokinetic properties of 22a by a twofold carbon/silicon exchange in its 3,5,5,8,8-pentamethyl-5,6,7,8-tetrahydro-2-naphthyl group, and the same considerations apply as those discussed for the C/Si-pair 21a/21b, except for the fact that AG-045572 (22a) is an antagonist, not an agonist (different from the retinoid agonist bexarotene (21a)).

Compound 22b should be synthesized on a gram-scale ${ }^{31}$ to allow for comparison of the $\mathrm{C} / \mathrm{Si}$ pair 22a/22b regarding their antagonizing effects at the GnRH receptor.

## 2.4 (Chloromethyl)silanes

### 2.4.1 Tris(chloromethyl)silanes

(Chloromethyl)silanes are versatile starting materials for the synthesis of organofunctional silanes. ${ }^{32}$ The coupling reaction between chlorosilanes and (chloromethyl)lithium, generated in situ from bromochloromethane and $n$-butyllithium in THF, has been demonstrated to be an excellent preparative method for the synthesis of (chloromethyl)silanes. ${ }^{33,34}$ Silanes with more than one $\mathrm{SiCH}_{2} \mathrm{Cl}$ moiety and compounds of this type with additional Si -functional groups are of great interest for synthetic organosilicon chemistry. There is a need for convenient and reliable preparative methods for the synthesis of such compounds, for instance for the development of new silicon-based drugs that contain more than one Si-bound organofunctional group.

Investigations prior to this work have shown that neither the photochlorination of methylsilanes ${ }^{35}$ nor the reaction of chlorosilanes with diazomethane ${ }^{36,37}$ are convenient methods for the preparation of such compounds, since both methods suffer from their lack of selectivity and broad applicability to a wide range of chloro(organyl)silanes. In addition, the diazomethane method
is problematic due to its dangerous handling and the toxicity of this reagent. On the other hand, previous attempts to prepare chlortris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24), starting from trichloro(chloromethyl)silane and using the reagent system $\mathrm{BrCH}_{2} \mathrm{Cl} / n-$ BuLi , were unsuccessful, since the only product which could be isolated was terakis(chloromethyl)silane. ${ }^{38}$ This clearly points at the necessity to protect one out of the four valencies at the silicon atom using a protecting group. In context with the studies on silavenlafaxine (12b), the Si -2,4,6-trimethoxyphenyl (Si-2,4,6-TMOP) group was developed as a novel protecting group in organosilicon chemistry, and therefore it should be used to develop methods for the synthesis of chlortris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24) ${ }^{39}$ (although (2,4,6-trimethoxyphenyl)silanes have been synthesized and studied before, ${ }^{40}$ these studies were not aimed at the development of the $\mathrm{Si}-2,4,6-\mathrm{TMOP}$ moiety as a protecting group).

| :---: | :---: |
| $\mathbf{2 3}$ | $\mathbf{2 4}$ |

### 2.4.2 Dichlorobis(chloromethyl)silane

Dichlorobis(chloromethyl)silane (25) is accessible either by stepwise chloromethylation of tetrachlorosilane using diazomethane ${ }^{37}$ or by chloromethylation of dichlorodiphenylsilane using $\mathrm{BrCH}_{2} \mathrm{Cl} / n-\mathrm{BuLi}^{34}$, followed by cleavage of the $\mathrm{Ph}-\mathrm{Si}$-bonds using triflic acid and subseqent treatment with triethylammonium chloride. Since these methods both involve dangerous (i.e., diazomethane) or aggressive (i.e., triflic acid) reagents, it was to be explored if the use of the Si-2,4,6-TMOP group would offer a better alternative for the preparation of dichlorobis(chloromethyl)silane (25).

### 2.5 Silicon-based allosteric modulators of muscarinic $\mathbf{M}_{2}$ receptors

W84 (11) is an allosteric agent for the "common allosteric site" of muscarinic $\mathrm{M}_{2}$ receptors, its allosteric action being characterized by an inhibition of the dissociation of the orthosteric ligand $\left[{ }^{3} \mathrm{H}\right]$ NMS and by a decrease of $\left[{ }^{3} \mathrm{H}\right]$ NMS equilibrium binding. Previous studies have lead to the development of $\mathbf{1 0}$ as a new lead structure for allosteric modulators of muscarinic $\mathrm{M}_{2}$ receptors ( $\mathrm{N}^{+} / \mathrm{Si}$ exchange), since, in contrast to the parent alkanediaminium type compound W84 (11), the allosteric action of $\mathbf{1 0}$ was characterized by an enhancement of $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ equilibrium binding to muscarinic $\mathrm{M}_{2}$ receptors. ${ }^{13}$

Whereas there are plenty of data on W84-type allosteric modulators and related compounds, ${ }^{41,42}$ only five silicon-based allosteric modulators of the "10-type" are known so far (variation of the number of $\mathrm{CH}_{2}$ groups of the central $\left(\mathrm{CH}_{2}\right)_{6}$ spacer ranging from four to eight $\mathrm{CH}_{2}$ groups). ${ }^{13}$ Hence, a number of structural modifications of $\mathbf{1 0}$ were to be prepared (compounds 2650, rac-51, and rac-52; see Chart 3 (page 27) for a detailed list of all target structures) in order to establish SAR studies of the silicon-based allosteric modulators of the "10-type". The moieties to be modified were (i) the central $\left(\mathrm{CH}_{2}\right)_{6}$ spacer; the $\left(\mathrm{CH}_{2}\right)_{\mathrm{n}}$ spacer length of the target molecules was chosen to be $\mathrm{n}=4-6(\rightarrow$ compounds 26-45), since the most interesting pharmacological activity of this type of compound had been found for a spacer length of and around five methylene groups. ${ }^{13}$ (ii) Instead of the lateral phthalimido moieties, which are part of the molecular structure of $\mathbf{1 0}$, molecules with lateral 1,8-naphthalimido, phthalimido, 4-methylphthalimido, and succinimido moieties were to be synthesized. Since the highest biological activities were found for the 1,8 naphthalimido group in the case of the W84-type compounds, ${ }^{42}$ this group was chosen as a "standard" (or "reference") group, and non-symmetrical derivatives of $\mathbf{1 0}$ containing different lateral imido moieties should be varied against the 1,8 -naphthalimido group to be present at the opposite terminus of the target cations ( $\rightarrow$ compounds 26-48). ${ }^{43}$ (iii) Recently, compounds appeared in the literature in which the lateral phthalimido moieties in the molecular structure of W84 (11) were substituted for 4-methylphthalimido moieties and/or the lateral $\left(\mathrm{CH}_{2}\right)_{3}$ spacers were

26-50, rac-51, and rac-52

substituted for $\mathrm{CH}_{2} \mathrm{CH}\left(\mathrm{CH}_{3}\right) \mathrm{CH}_{2}$ spacers resulting in a switch of the allosteric action of this type of compound from negative to positive cooperativity. ${ }^{12 e, 41 r, 42 c}$ The same structural variation was to be applied to the silicon-based "10-type" allosteric modulators to elucidate whether synergetic effects could be used to augment the positive cooperativity of $\mathbf{1 0}(\rightarrow$ compounds $\mathbf{4 9}, \mathbf{5 0}$, rac-51, and rac52).

In addition to the synthesis of the allosteric modulators 26-50, rac-51, and rac-52, which contain a permanently positively charged quaternary nitrogen atom, the tertiary derivative $\mathbf{5 3}$ was to be synthesized, since tertiary amines are in a dynamic equilibrium with their corresponding protonated ammonium salts under physiological conditions and the free base is expected to show a high propensity to penetrate the blood-brain barrier. The lateral moieties of $\mathbf{5 3}$ were chosen to be 1,8-naphthalimido groups (for which the highest biological activities in the SAR of the W84-type compounds had been observed, ${ }^{41}$ see above), and the length of the central spacer was chosen to be $\left(\mathrm{CH}_{2}\right)_{6}$, since SAR data for the W84-type compounds is most plentiful for this spacer length, thus ensuring the best comparability of the W84-type SAR data to that of $\mathbf{5 3}$.

53

### 2.6 Sila-gabapentin

Gabapentin (54a), an analog of 4 -aminobutyric acid, currently is in clinical use as an antiepileptic. The synthesis of its silicon analog sila-gabapentin (54b) ${ }^{44}$ was especially challenging, since it has a carbonyl moiety in the $\beta$-position to the silicon atom. ${ }^{45,46}$ The reactivity of $\beta$ carbonylsilanes is mainly based on the weakness of the $\mathrm{Si}-\mathrm{CH}_{2} \mathrm{C}(\mathrm{O}) \mathrm{R}$ bond, which is an intrinsic obstacle when tranformations of $C$-functionalized organyl groups at the silicon atom are intended. Therefore, most of the publications on the reactivity of $\beta$-carbonylsilanes report on reactions involving cleavage of the $\mathrm{Si}-\mathrm{CH}_{2} \mathrm{C}(\mathrm{O}) \mathrm{R}$ bond. ${ }^{47}$ A typical example of this is the use of $\mathrm{Me}_{3} \mathrm{SiCH}_{2} \mathrm{CO}_{2} \mathrm{Et}$ as a silylating agent. Despite this intrinsic obstacle, sila-gabapentin (54b) was to be synthesized, if possible, in reasonable quantities for its pharmacological characterization.

## 3 Synthesis of sila-venlafaxine and derivatives

### 3.1 Synthesis of racemic and non-racemic sila-venlafaxine

### 3.1.1 Method A: synthesis of rac-sila-venlafaxine (rac-12b) via a hydridosilane

 rac-Sila-venlafaxine hydrochloride $(\operatorname{rac}-\mathbf{1 2 b} \cdot \mathrm{HCl})$ was prepared in $15 \%$ overall yield in a multistep synthesis, starting from tetrachlorosilane (Scheme 1). Thus, treatment of tetrachlorosilane with 1,5-bis(bromomagnesio)pentane gave 1,1-dichloro-1-silacyclohexane (55) (yield 62\%), which upon methanolysis, in the presence of triethylamine, afforded 1,1-dimethoxy-1-silacyclohexane (56) (yield $80 \%$ ). Alternatively, compound 56 was synthesized by reaction of tetramethoxysilane with 1,5-bis(bromomagnesio)pentane (yield 43\%). Treatment of 4-methoxyacetophenone 2,4,6-

Scheme 1. Synthesis of rac-sila-venlafaxine (rac-12b) via a hydridosilane.
triisopropylbenzenesulfonylhydrazone (57) with $n$-butyllithium, in the presence of $N, N, N^{\prime}, N^{\prime}$ tetramethylethylenediamine (TMEDA), gave the intermediate [1-(4-methoxyphenyl)vinyl]lithium (58) (Shapiro reaction), which upon reaction with 56 afforded 1-methoxy-1-[1-(4-methoxyphenyl)vinyl]-1-silacyclohexane (59) (yield 45\%), which was then reacted with lithium aluminum hydride to give 1-[1-(4-methoxyphenyl)vinyl]-1-silacyclohexane (60) (yield 82\%). The lithium dimethylamide-catalyzed reaction of 60 with dimethylamine ( $\rightarrow$ rac-16), followed by hydrolysis, yielded rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclohexan-1-ol (rac-sila-venlafaxine, rac - 12b) (yield $90 \%$ ). The isolation and purification of the intermediate rac$\mathbf{1 6}$ in the transformation $\mathbf{6 0} \rightarrow$ rac-12b was not necessary. Treatment of rac-12b with an ethereal hydrogen chloride solution finally afforded the hydrochloride rac-12b•$\cdot \mathrm{HCl}$ (yield $90 \%$ ). To characterize the intermediate rac-1-(dimethylamino)-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclohexane (rac-16), this compound was also isolated and purified (yield 76\%).

### 3.1.2 Method B: synthesis of rac-sila-venlafaxine (rac-12b) using the Si-2,4,6trimethoxyphenyl group as a protecting group

As shown below in Scheme 5 (p. 15, Section 3.3), the reaction pathways which were successful for the preparation of rac-sila-venlafaxine (rac-12b) (as displayed in Scheme 1 (p. 11, Section 3.1.1)) could not be applied to synthesize its four-membered ring system derivative rac-14; cf. Scheme 5 (p. 15, Section 3.3). Nevertheless, the problems which were encountered during the attempted synthesis of rac-14 according to Scheme 5 were a stimulus to search for unconventional alternatives, resulting in the development of the Si-2,4,6-trimethoxyphenyl moiety as a novel protecting group; cf. Scheme 6 (p. 17, Section 3.3). Concomitantly, the synthesis of rac-silavenlafaxine ( $\mathrm{rac}-\mathbf{1 2 b}$ ) as shown in Scheme 1 suffered from the drawback that large amounts of iodomethane had to be used during the workup of the intermediate 59 and the fact that hydridosilanes (such as $\mathbf{6 0}$ ) pose a danger in large-scale syntheses.

The methods shown in Scheme 6 were suitable to circumvent these problems, and, therefore, rac-sila-venlafaxine (rac-12b) was synthesized according to Scheme 2 using analogous reaction pathways as those shown in Scheme 6 in a multistep synthesis in $21 \%$ or $27 \%$ (without isolation of 63) overall yield, starting from 1,1-dichloro-1-silacyclohexane (55). Thus, reaction of 55 with one molar equivalent of (2,4,6-trimethoxyphenyl)lithium, followed by methanolysis of the remaining $\mathrm{Si}-\mathrm{Cl}$ bond, yielded 1-methoxy-1-(2,4,6-trimethoxyphenyl)-1-silacyclohexane (61) (yield 66\%). Treatment of $\mathbf{6 1}$ with [1-(4-methoxyphenyl)vinyl]lithium (58) gave 1-[1-(4-methoxyphenyl)vinyl]-1-(2,4,6-trimethoxyphenyl)-1-silacyclohexane (62) (yield 47\%), which in turn was used to prepare

1-chloro-1-[1-(4-methoxyphenyl)vinyl]-1-silacyclohexane (63) (yield 77\%) by treatment with an ethereal hydrogen chloride solution (selective cleavage of the $\mathrm{Si}-2,4,6$-TMOP protecting group; no side products arising from cleavage of the other $\mathrm{Si}-\mathrm{C}$ bonds could be detected by GC-MS analysis). Reaction of $\mathbf{6 3}$ with dimethylamine/lithium dimethylamide, followed by hydrolysis, finally afforded rac-12b (yield 86\%). Alternatively, rac-12b was prepared directly from $\mathbf{6 2}$ by treatment with an ethereal hydrogen chloride solution (no isolation of the resulting chlorosilane 63), followed by reaction with dimethylamine/lithium dimethylamide and subsequent hydrolysis (yield 86\%). In the transformation $\mathbf{6 3} \rightarrow$ rac-12b, rac-1-(dimethylamino)-1-[2-(dimethylamino)-1-(4-methoxyphenyl)-ethyl]-1-silacyclohexane (rac-16) was shown to be an intermediate (comparison with an authentic sample; GC-MS analysis).

Scheme 2. Synthesis of rac-sila-venlafaxine (rac-12b) using the $\mathrm{Si}-2,4,6$-trimethoxyphenyl moiety as a novel protecting group.

### 3.1.3 Resolution of rac-sila-venlafaxine (rac-12b)

$(R)$-Sila-venlafaxine $((R) \mathbf{- 1 2 b})$ was prepared according to Scheme 3 by resolution of rac-12b, using $(+)$-10-camphorsulfonic acid $((+)$-CSA) as the resolving agent $(\rightarrow(R) \mathbf{- 1 2 b} \cdot(+)$-CSA; yield $30 \%$, related to $\mathrm{rac} \mathbf{- 1 2 b}$ ). Treatment of the diastereomerically pure salt $(R) \mathbf{- 1 2 b} \cdot(+)$-CSA with an aqueous potassium carbonate solution gave $(R) \mathbf{- 1 2 b}$ (yield $99 \%$ ). The antipode $(S)$ - $\mathbf{1 2 b}$ was
prepared analogously, starting from the mother liquor obtained in the preparation of $(R)$ - $\mathbf{1 2 b} \cdot(+)$ CSA and using $(-)$-CSA as the resolving agent $(\rightarrow(S) \mathbf{- 1 2 b} \cdot(-)$-CSA $)$. The enantiopure hydrochlorides $(R) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ and $(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ were prepared by treatment of $(R) \mathbf{- 1 2 b}$ and $(S) \mathbf{- 1 2 b}$, respectively, with an ethereal hydrogen chloride solution (yield $27-28 \%$, related to rac-12b). ${ }^{48}$ Reaction of $(R) \mathbf{- 1 2 b}$ with triphenylphosphonium bromide afforded $(R)-\mathbf{1 2 b} \cdot \mathrm{HBr}$ (yield $90 \%$ ), ${ }^{49}$ the crystal structure analysis of which allowed the assignment of the absolute configurations of the silavenlafaxine enantiomers (see below).

Scheme 3. Resolution of rac-sila-venlafaxine (rac-12b).

### 3.2 Synthesis of the rac-sila-venlafaxine derivative rac-1-[2-(dimethyl-amino)-1-(4-methoxyphenyl)ethyl]-1-silacyclopentan-1-ol (rac-13)

The sila-venlafaxine derivative rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-sila-cyclopentan-1-ol (rac-13) and its hydrochloride rac-13. HCl were prepared analogous to the synthesis of rac-12b $\cdot \mathrm{HCl}$ via the intermediates 64-67 and rac-68, starting from tetrachlorosilane, and were isolated in 5\% overall yield (Scheme 4).

Scheme 4. Synthesis of the sila-venlafaxine derivative rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-sila-cyclopentan-1-ol (rac-13).

### 3.3 Attempted synthesis of the rac-sila-venlafaxine derivative rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclobutan-1-ol (rac-14)

The reaction pathways that were established for the synthesis of rac-sila-venlafaxine (rac12b) as shown in Scheme 1 (p. 11, Section 3.1.1) have also been applied to 1,1 -dichloro-1silacyclobutane (69) in an attempt to prepare the rac-sila-venlafaxine derivative rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclobutan-1-ol (rac-14). In this context, 1,1-dimethoxy-1-silacyclobutane (70) (yield 55\%), 1,1-diisopropoxy-1-silacyclobutane (71) (yield $62 \%$ ), and 1,1-di-tert-butoxy-1-silacyclobutane (72) (yield 56\%) were synthesized from 69. ${ }^{50}$

Scheme 5. Reaction of $\mathbf{5 8}$ with equimolar amounts of the 1,1-dialkoxy-1-silacyclobutanes 70-72.

Twofold substitution took place when equimolar amounts of $\mathbf{5 8}$ and $\mathbf{7 0}$ were reacted according to Scheme 5 , even at low temperature $\left(-78{ }^{\circ} \mathrm{C}\right),{ }^{51}$ affording 1,1-bis-[1-(4-methoxyphenyl)vinyl]-1silacyclobutane (73; yield $70 \%$ (related to $\mathbf{5 8}$ ) ${ }^{52} / 33 \%$ (related to $\mathbf{7 0}$ )). Very similar results were obtained in experiments using equimolar amounts of $\mathbf{5 8}$ and 71 or 72 (GC control, no further workup). Considering these results, a preparation of rac-14 analogous to the synthesis of rac-12b did not seem to be promising.

Instead, a different approach was pursued. The unexpected ease of substitution of the second alkoxy functionality in the 1,1-dialkoxy-1-silacyclobutanes 70-72 clearly warranted the use of a blocking (or protecting) group attached to the silacyclobutane backbone before treatment with 58. It was decided to use the Si -2,4,6-trimethoxyphenyl (Si-2,4,6-TMOP) group for several reasons: (i) (2,4,6-trimethoxyphenyl)lithium, required for the preparation of (2,4,6-trimethoxyphenyl)silanes, can be prepared very easily by deprotonation of $1,3,5$-trimethoxybenzene with $n$ butyllithium/TMEDA. (ii) The ortho-methoxy groups, which are present adjacent to the silicon atom after one of the two leaving groups in 69 has been displaced by a Si-2,4,6-TMOP group, were expected to pose significant steric demand, thus leading to a high selectivity (no twofold substitution of both chlorine atoms in $\mathbf{6 9}$ by ( $2,4,6$-trimethoxyphenyl)lithium). (iii) Since methoxy groups attached to a benzene ring significantly facilitate electrophilic substitution reactions in their ortho and para position(s), the $\mathrm{Si}-2,4,6-\mathrm{TMOP}$ bond of the protected $(2,4,6$ trimethoxyphenyl)silanes was expected to be easily cleavable by electrophilic reagents, especially by Brønsted acids.

Thus, treatment of 1,1-dichloro-1-silacyclobutane (69) with one molar equivalent of (2,4,6trimethoxyphenyl)lithium, followed by methanolysis of the remaining $\mathrm{Si}-\mathrm{Cl}$ bond, afforded 1-methoxy-1-(2,4,6-trimethoxyphenyl)-1-silacyclobutane (74) (yield 58\%) (Scheme 6). No side products were detected (GC), indicating that twofold substitution did not take place in the reaction of 69 with (2,4,6-trimethoxyphenyl)lithium. Treatment of 74 with [1-(4methoxyphenyl)vinyl]lithium (58) gave 1-[1-(4-methoxyphenyl)vinyl]-1-(2,4,6-trimethoxyphenyl)-1-silacyclobutane (75) (yield 62\%), which in turn was used to prepare 1-chloro-1-[1-(4-methoxyphenyl)vinyl]-1-silacyclobutane (76) (yield 53\%) by treatment with an ethereal hydrogen chloride solution (selective cleavage of the Si-2,4,6-TMOP protecting group; no side products arising from cleavage of the other $\mathrm{Si}-\mathrm{C}$ bonds could be detected by GC-MS analysis). Subsequent treatment of 76 with dimethylamine/lithium dimethylamide (analogous to the transformation $\mathbf{6 3} \rightarrow$ rac-12b) surprisingly afforded bis(dimethylamino)[2-(dimethylamino)-1-(4methoxyphenyl)ethyl]propylsilane (77) (yield 57\%); i.e., in addition to the attempted chloro/dimethylamino exchange at the silicon atom and the amine addition to the vinyl group, ring
opening ( $\mathrm{Si}-\mathrm{C}$ cleavage) of the silacyclobutane skeleton took place. This ring opening, which can be explained by the higher ring strain compared to that of the silacyclohexane skeleton, prevented the synthesis of rac-14 by this route.

Scheme 6. Attempted synthesis of rac-14 using the Si-2,4,6-trimethoxyphenyl moiety as a novel protecting group.

### 3.4 Synthesis of rac-desmethoxy-sila-venlafaxine (rac-1-[2-(dimethyl-amino)-1-phenylethyl]-1-silacyclohexan-1-ol, rac-15)

rac-Desmethoxy-sila-venlafaxine
(rac-1-[2-(dimethylamino)-1-phenylethyl]-1-silacyclo-hexan-1-ol, rac-15) and its hydrochloride rac-15•HCl were prepared in multistep syntheses, starting from 1,1-dimethoxy-1-silacyclohexane (56) (Scheme 7). Thus, reaction of $\mathbf{5 6}$

Scheme 7. Synthesis of rac-desmethoxy-sila-venlafaxine (rac-15).
with (1-phenylvinyl)magnesium bromide ${ }^{53}$ gave 1-methoxy-1-(1-phenylvinyl)-1-silacyclohexane (78) (yield 59\%), which upon treatment with lithium aluminum hydride afforded 1-(1-phenylvinyl)-1-silacyclohexane (79) (yield $83 \%$ ). Compound 79 was then reacted with dimethylamine, in the presence of lithium dimethylamide, to give rac-1-(dimethylamino)-1-[2-(dimethylamino)-1-phenylethyl]-1-silacyclohexane (rac-80) (yield 40\%). Hydrolysis of rac-80 afforded rac-15 (yield $91 \%$ ), which upon treatment with an ethereal hydrogen chloride solution gave the corresponding hydrochloride rac-15. HCl (yield 93\%).

In the course of the synthesis of rac-80, the formation of 1,1-bis(dimethylamino)-1silacyclohexane (81) and dimethyl-(2-phenylethyl)amine (82) was observed (comparison with authentic samples, GC-MS analysis of the reaction mixture), resulting from an $\mathrm{Si}-\mathrm{C}$ bond cleavage induced by a nucleophilic attack of $\mathrm{LiNMe}_{2}$ at the silicon atom. This cleavage reaction is mainly responsible for the poor yield of rac-80. Interestingly, no cleavage of the corresponding $\mathrm{Si}-$ $\mathrm{C}(\mathrm{H})($ Aryl $)$ bonds was observed in the course of the comparable reactions $\mathbf{6 0} \rightarrow$ rac-16, $\mathbf{6 3} \rightarrow$ rac$16,67 \rightarrow$ rac- 68 , or $76 \rightarrow 77$.

Chart 2. Side products formed in the course of the synthesis of rac-80.

### 3.5 Synthesis of sila-venlafaxine prodrugs

The sila-venlafaxine prodrugs rac-17 and rac-18 were synthesized according to Scheme 8, starting from rac -16, which is an intermediate in the synthesis of rac -sila-venlafaxine ( rac - $\mathbf{1 2 b}$ ); cf. Scheme 1 (p. 11, Section 3.1.1). Thus, acetic acid anhydride-catalyzed ${ }^{54}$ reaction of rac- $\mathbf{1 6}$ in

Scheme 8. Synthesis of the rac-sila-venlafaxine produgs rac-17, rac-18, and rac-18•HCl.
methanol gave rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-methoxy-1-silacyclohexane (rac-17) (yield 87\%), which was then reacted with lithium aluminum hydride to give rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclohexane (rac-18) (yield 73\%). In order to obtain a stable storage form of rac-18 (rapid base-catalyzed hydrolysis of $\mathrm{Si}-\mathrm{H}$ bonds in the presence of atmospheric moisture), the corresponding hydrochloride rac- $\mathbf{1 8} \cdot \mathrm{HCl}$ was prepared by treatment of rac-18 with an ethereal hydrogen chloride solution (yield 79\%), thus inactivating the basic amino moiety present in the molecule.

## 4 Synthesis of disila-bexarotene

Disila-bexarotene (21b) was synthesized in a multistep synthesis, starting from 1,2bis(chlorodimethylsilyl)ethane (83) (Scheme 9). Thus, treatment of $\mathbf{8 3}$ with ethynylmagnesium bromide gave 1,2-bis(ethynyldimethylsilyl)ethane (84) (yield $80 \%$ ). Alternatively, sodium acetylide instead of ethynylmagnesium bromide was used for this preparation (yield 71\%). Treatment of methyl 4-formylbenzoate (85) with 1-propynylmagnesium bromide, followed by reaction with chlorotrimethylsilane, afforded methyl 4-[1-(trimethylsiloxy)but-2-ynyl]benzoate (86) (yield 61\%). Compounds 84 and $\mathbf{8 6}$ were then reacted in a cobalt-catalyzed $\left[\mathrm{CpCo}(\mathrm{CO})_{2}\right]$ Vollhardt cyclization, ${ }^{55}$ followed by treatment with methanol in the presence of acetic acid, to give methyl 4-[hydroxy-(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methyl]benzoate (87) (yield 22\%). Oxidation of the alcohol 87 using Swern conditions (oxalyl chloride, dimethyl sulfoxide, triethylamine) afforded the corresponding ketone $\mathbf{8 8}$ (yield $87 \%$ ), which was transformed into the corresponding olefin 89 using a Wittig-type reaction (yield $90 \%$ ). Treatment of $\mathbf{8 9}$ with potassium hydroxide in methanol/water and subsequent acidification with hydrochloric acid finally afforded the title compound 21b (yield 96\%). ${ }^{48}$

Scheme 9. Synthesis of disila-bexarotene (21b).

## 5 Synthesis of disila-AG045572

Two different methods were pursued for the synthesis of disila-AG045572 (22b). The first one was planned using a lithiation reaction by deprotonation of a furan moiety as the key step (Scheme 10). Thus, 2-(chloromethyl)furan (90) was prepared according to a literature method ${ }^{56}$ from 2-furylmethanol by reaction with thionyl chloride in the presence of pyridine. Treatment of $\mathbf{9 0}$ with 1-propynylmagnesium bromide yielded a mixture of 2-(but-2-ynyl)furan (91) (29\% yield) and 5-methyl-2-prop-1-ynylfuran (92) (10\% yield), which were separated by distillation with a spinning band column. Compounds 84 and 91 were then reacted in a cobalt-catalyzed $\left[\mathrm{CpCo}(\mathrm{CO})_{2}\right]$ Vollhardt cyclization ${ }^{55}$ to give 2-[(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methyl]furan ( $\mathbf{9 3}$ ) ( $41 \%$ yield). Compound 93 was then treated with one molar equivalent of various common lithiation reagents (e.g., $n$-BuLi/TMEDA) under various reaction conditions with the aim to lithiate the 5-position of the furan moiety. The reactions were monitored by quenching an aliquot of the reaction mixture with chlorotrimethylsilane and subsequent GC/EI MS analysis, which clearly showed that half of the amount of the starting material had been lithiated and silylated twice $\left(\rightarrow \mathrm{C}_{24} \mathrm{H}_{42} \mathrm{OSi}_{4}, m / z=458\right.$, at least two products, cf. Figure 1; for reaction conditions, see Table 1),

Scheme 10. Attempted synthesis of disila-AG045572 (22b) using a deprotonation reaction as the key step.
whereas the second half of $\mathbf{9 3}$ had remained unreacted. ${ }^{57}$ This result prevented the preparation of \{5-[(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methyl]-2-furyl $\}$ lithium (94) by this route, which was planned to be reacted with 2-isocyanato-1,3,5-trimethoxybenzene to yield 22b after aqueous workup.

Figure 1. GC/EI MS analysis of a representative lithiation/silylation sequence of compound 93. Top, trace of $m / z=458$ (i.e., products obtained from a twofold lithiation/silylation sequence); middle, trace of $m / z=314$ (i.e., starting material); bottom, integration of all positive ions detected $(\mathrm{m} / \mathrm{z} \geq 50)$. The isotope pattern of the peaks with $m / z=458$ (top) were in excellent agreement with the formula $\mathrm{C}_{24} \mathrm{H}_{42} \mathrm{OSi}_{4}$; no ions with $m / z>458$ were detected except for the isotope peaks within the pattern.

Table 1. Reagents and conditions used for the lithiation of $\mathbf{9 3}$ and results obtained from these experiments.

| Reagent(s) | Solvent | Temperature | Result |
| :---: | :---: | :---: | :---: |
| $n$-BuLi | $\mathrm{Et}_{2} \mathrm{O}$ | $1 .-78^{\circ} \mathrm{C} ; 2.0^{\circ} \mathrm{C}$ | no reaction |
| $s$-BuLi | THF | $1 .-78^{\circ} \mathrm{C} ; 2.0^{\circ} \mathrm{C}$ | twofold lithiation |
| $t$-BuLi | THF | $1 .-78^{\circ} \mathrm{C} ; 2.0^{\circ} \mathrm{C}$ | twofold lithiation |
| $n$-BuLi, TMEDA | $n$-hexane | $0^{\circ} \mathrm{C}$ | twofold lithiation |
| $n$-BuLi, TMEDA | $n$-hexane, THF | $0^{\circ} \mathrm{C}$ | twofold lithiation |
| $n$-BuLi, cat. $i$-Pr NH | THF | $0^{\circ} \mathrm{C}$ | twofold lithiation |
| $n$-BuLi, TMEDA | $n$-hexane | $-78^{\circ} \mathrm{C}$ | no reaction |
| $i$ - $\mathrm{Pr}_{2} \mathrm{NLi}$ | THF | $1.0^{\circ} \mathrm{C} ; 2.20^{\circ} \mathrm{C}$ | no reaction |

The second approach to synthesize disila-AG-045572 (22b) proceeded via a halogen/metal exchange. ${ }^{58}$ The target compound 22b was prepared by various methods in multistep syntheses, starting from 1,2-bis(ethynyldimethylsilyl)ethane (84) and 5-bromo-2-furoic acid (95) (Scheme 11). Reaction of 95 with 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU) and iodomethane gave methyl 5-bromo-2-furoate (96) ( $82 \%$ yield), which was treated with (i) isopropylmagnesium bromide and (ii) 1-bromobut-2-yne in the presence of copper(I) cyanide to give methyl 5-(but-2-ynyl)-2-furoate (97) ( $62 \%$ yield). Compounds $\mathbf{8 4}$ and $\mathbf{9 7}$ were then reacted in a cobalt-catalyzed $\left(\mathrm{CpCo}(\mathrm{CO})_{2}\right)$ Vollhardt cyclization ${ }^{55}$ to afford methyl 5-[(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)-methyl]-2-furoate (98) (39\% yield). Reaction of $\mathbf{9 8}$ with potassium hydroxide, followed by treatment with hydrochloric acid, gave the corresponding acid $\mathbf{9 9}$ ( $92 \%$ yield). Treatment of $\mathbf{9 9}$ with thionyl chloride and pyridine, in the presence of 4 -(dimethylamino)pyridine (DMAP), and subsequent reaction with $2,4,6$-trimethoxyaniline (101) gave the target compound 5-[(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methyl]- $N$-(2,4,6-trimethoxyphenyl)furan-2carboxamide (disila-AG-045572, 22b) ( $22 \%$ yield). Treatment of $\mathbf{9 9}$ with dicyclohexylcarbodiimide (DCC) and pyridine, in the presence of DMAP, and subsequent reaction with $\mathbf{1 0 1}$ afforded $\mathbf{2 2 b}$ as

well ( $37 \%$ yield). Alternatively, compound $\mathbf{2 2 b}$ was synthesized by treatment of $\mathbf{9 8}$ with a reagent obtained from trimethylaluminum and $\mathbf{1 0 1} \cdot \mathrm{HCl}(83 \%$ yield $)$.

Compounds 101 and $\mathbf{1 0 1} \cdot \mathrm{HCl}$ were obtained from 2,4,6-trimethoxybenzamide-methanol $(\mathbf{1 0 0} \cdot \mathrm{MeOH})$ (Scheme 12). Treatment of $\mathbf{1 0 0} \cdot \mathrm{MeOH}$ with an aqueous potassium hypochlorite solution gave 101 ( $38 \%$ yield), which upon reaction with hydrogen chloride in diethyl ether afforded $\mathbf{1 0 1} \cdot \mathrm{HCl}(98 \%$ yield $)$.

Scheme 12. Preparation of 2,4,6-trimethoxyaniline (101) and 2,4,6-trimethoxyanilinium chloride $(\mathbf{1 0 1} \cdot \mathrm{HCl})$.

## 6 Synthesis of (chloromethyl)silanes

### 6.1 Synthesis of chlorotris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24)

The chlorotris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24) were synthesized according to Scheme 13, starting from tetrachlorosilane. Thus, reaction of $\mathrm{SiCl}_{4}$ with one molar equivalent of (2,4,6-trimethoxyphenyl)lithium yielded trichloro(2,4,6-trimethoxyphenyl)silane (102) (yield 65\%), which upon treatment with $\mathrm{BrCH}_{2} \mathrm{Cl} / n-\mathrm{BuLi}$ gave tris(chloromethyl)(2,4,6-trimethoxyphenyl)silane (103) (yield 39\%). Treatment of 103 with an ethereal hydrogen chloride solution finally afforded $\mathbf{2 3}$ (yield $65 \%$ ), whereas methanolysis of $\mathbf{1 0 3}$, in the presence of trifluoroacetic acid, gave 24 (yield $69 \%$ ). The substitution of more than one chlorine atom of tetrachlorosilane was observed only in trace amounts (formation of dichlorobis(2,4,6-trimethoxyphenyl)silane (104); GC control) during the preparation of $\mathbf{1 0 2}$ when a 1:1 stoichiometry of tetrachlorosilane and (2,4,6-trimethoxyphenyl)lithium was maintained.

Scheme 13. Synthesis of chlorotris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24) using the Si-2,4,6-trimethoxyphenyl moiety as a protecting group.

### 6.2 Synthesis of dichlorobis(2,4,6-trimethoxyphenyl)silane (104) and attempted synthesis of dichlorobis(chloromethyl)silane (25) via 104

Dichlorobis(2,4,6-trimethoxyphenyl)silane (104) was synthesized by reaction of tetrachlorosilane with two molar equivalents of (2,4,6-trimethoxyphenyl)lithium (yield 67\%). Treatment of $\mathbf{1 0 4}$ with $\mathrm{BrCH}_{2} \mathrm{Cl} / n$ - BuLi , however, did not yield bis(chloromethyl)bis(2,4,6trimethoxyphenyl)silane (105), which can be explained by the poor solubility of $\mathbf{1 0 4}$ in
tetrahydrofuran (THF) at $-70{ }^{\circ} \mathrm{C}$. ${ }^{59}$ After the reaction mixture was warmed to $20^{\circ} \mathrm{C}$, GC analysis showed that $\mathbf{1 0 4}$ had remained untouched.

Scheme 14. Synthesis of dichlorobis(2,4,6-trimethoxyphenyl)silane (104) and attempted synthesis of dichlorobis(chloromethyl)silane (25) via 104.

## 7 Synthesis of W84-type silicon-based allosteric modulators of muscarinic $\mathbf{M}_{2}$ receptors

### 7.1 Synthesis of silicon-based allosteric modulators containing a quaternary ammonium nitrogen atom

The allosteric modulators 10, 26-50, rac-51, and $\mathrm{rac}-\mathbf{5 2}^{60}$ (Chart 3) were synthesized, starting from chlorodimethylsilane, in multistep syntheses according to Scheme 15. Thus, platinumcatalyzed $\left(\mathrm{H}_{2} \mathrm{PtCl}_{6}\right)$ hydrosilylation of the $\omega$-bromo-1-alkenes $\mathrm{H}_{2} \mathrm{C}=\mathrm{CH}\left(\mathrm{CH}_{2}\right)_{\mathrm{n}-2} \mathrm{Br}(\mathrm{n}=2-4)$ with chlorodimethylsilane afforded the ( $\omega$-bromoalkyl)chlorodimethylsilanes 106-108 (yield 70\% (106, $\mathrm{n}=4), 77 \%(107, n=5)$, or $83 \%(108, n=6))$, which upon reaction with lithium aluminum hydride gave the ( $\omega$-bromoalkyl)dimethylsilanes 109-111 (yield $84 \%(109, n=4), 87 \%(110, n=5)$, or $91 \%(111, \mathrm{n}=6)$ ) (see Chart 4). Subsequent platinum-catalyzed $\left(\mathrm{H}_{2} \mathrm{PtCl}_{6}\right)$ hydrosilylation of the $N$ allylimides 112-116 (synthesized according to Scheme 16; for yields, see also Scheme 16) with the ( $\omega$-bromoalkyl)dimethylsilanes 109-111 gave the ( $\omega$-bromoalkyl)dimethyl(3-imidopropyl)silanes 117-126 and rac-127 (for the yields, see Chart 5), which were then reacted with the (3-imidopropyl)dimethylamines ${ }^{61} \mathbf{1 2 8 - 1 3 1}$ and rac-132 (synthesized according to Scheme 16; compound rac-132 was synthesized via the intermediates rac-133 and rac-134; for the yields, see also Scheme 16) to afford the allosteric modulators 10, 26-50, rac-51, and rac-52 (for the yields, see Chart 3). ${ }^{60}$

### 7.2 Synthesis of a silicon-based allosteric modulator containing a tertiary nitrogen atom

(6-Bromohexyl)dimethyl[3-(1,8-naphthalimido)propyl]silane (119) was reacted with methyl[3-(1,8-naphthalimido)propyl]amine (135) in the presence of excess triethylamine to afford 53. ${ }^{62}$ Treatment of $\mathbf{5 3}$ with an ethereal hydrogen chloride solution gave the corresponding hydrochloride $53 \cdot \mathrm{HCl}$ (yield $56 \%$, related to 119 ).

Compound 135 was synthesized by reaction of 1,8 -naphthalic acid anhydride with $N$ -methylpropane-1,3-diamine in refluxing glacial acetic acid (yield 70\%).

Scheme 17. Synthesis of an allosteric modulator containing a tertiary nitrogen atom.

## 8 Synthesis of $\beta$-carbonylsilanes: partial synthesis of sila-gabapentin

As discussed in Section 2.6 (p. 10), the weakness of the $\mathrm{Si}-\mathrm{CH}_{2} \mathrm{C}(\mathrm{O}) \mathrm{R}$ bond is an intrinsic obstacle when tranformations of $C$-functionalized organyl groups at the silicon atom are intended. The synthesis of sila-gabapentin (54b) was not achieved within this work, and this can be ascribed to that problem. Nevertheless, novel methods have been developed and known methods have been optimized and applied for (i) the synthesis of $\beta$-carbonylsilanes, with a silacyclohexane skeleton and an additional $C$-functionalized organyl group at the silicon atom, and for (ii) reactions of these compounds involving functional group transformations within the $C$-functionalized group without cleavage of the $\mathrm{Si}-\mathrm{CH}_{2} \mathrm{C}(\mathrm{O}) \mathrm{R}$ bond. The resulting preparative methods and data are documented below and in the Experimental Section.

The $\beta$-carbonylsilanes benzyl 2-[1-(chloromethyl)-1-sila-1-cyclohexyl]acetate (137) and tertbutyl 2-[1-(chloromethyl)-1-sila-1-cyclohexyl]acetate (139) were synthesized according to Scheme 18 by reaction of 1-chloro-1-(chloromethyl)-1-silacyclohexane (136) (prepared from trichloro(chloromethyl)silane in $52 \%$ yield by reaction with 1,5-bis(bromomagnesio)pentane ${ }^{63,64}$ ) with the lithium reagents $\mathrm{LiCH}_{2} \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{Ph}\left(\rightarrow \mathbf{1 3 7}\right.$, yield $43 \%$ ) or $\mathrm{LiCH}_{2} \mathrm{CO}_{2}{ }^{t} \mathrm{Bu}(\rightarrow \mathbf{1 3 9}$, yield $79 \%$ ) in the presence of 1,3-dimethyl-3,4,5,6-tetrahydropyrimidin-2(1H)-one (DMPU). Treatment of $\mathbf{1 3 7}$ and $\mathbf{1 3 9}$ with sodium azide gave benzyl 2-[1-(azidomethyl)-1-sila-1-cyclohexyl]acetate (138, yield $86 \%)^{65}$ and tert-butyl 2-[1-(azidomethyl)-1-sila-1-cyclohexyl]acetate (140, yield 89\%), respectively (Scheme 18).

Scheme 18. Synthesis of the $\beta$-carbonylsilanes 137-140.

Further transformations of $\mathbf{1 3 9}$ (see Scheme 19) include (i) the displacement of the tert-butyl group by a trimethylsilyl moiety by reaction with iodotrimethylsilane to give trimethylsilyl 2-[1-(chloromethyl)-1-sila-1-cyclohexyl]acetate (141, yield 85\%) and (ii) a chlorine/iodine exchange by reaction with sodium iodide to give tert-butyl 2-[1-(iodomethyl)-1-sila-1-cyclohexyl]acetate (142, yield $88 \%$ ).

Scheme 19. Synthesis of the $\beta$-carbonylsilanes 141 and 142.
Reaction of $\mathbf{1 4 0}$ with triphenylphosphine, followed by treatment with carbon dioxide, gave tert-butyl 2-[1-(isocyanatomethyl)-1-sila-1-cyclohexyl]acetate (143, yield 34\%), which upon reaction with tert-butanol afforded tert-butyl 2-\{1-[((tert-butoxycarbonyl)amino)methyl]-1-sila-1cyclohexyl \}acetate ( $\mathbf{1 4 4}$, yield $44 \%$ ) (Scheme 20). In addition, compound 140 was reacted with triphenylphosphine according to Scheme 20, followed by treatment with hydrochloric acid, to give $1,1^{\prime}$-oxybis $\{[(1$-sila-1-cyclohexyl)methyl]ammonium $\}$ dichloride ( $\mathbf{1 4 5}$, yield $38 \%$ ). Thus, the attempted transformation of the $\mathrm{SiCH}_{2} \mathrm{~N}_{3}$ group into the $\mathrm{SiCH}_{2} \mathrm{NH}_{2}$ moiety and the transformation of the $\mathrm{SiCH}_{2} \mathrm{CO}_{2}{ }^{t} \mathrm{Bu}$ group into the $\mathrm{SiCH}_{2} \mathrm{COOH}$ moiety in a one-pot synthesis $(\rightarrow$ formation of 54b) resulted in an $\mathrm{Si}-\mathrm{C}$ bond cleavage .

Scheme 20. Synthesis of the $\beta$-carbonylsilanes 143 and 144 and of the disiloxane 145.

## 9 Biological studies

### 9.1 Sila-venlafaxine and derivatives

Compounds rac-12a, rac-12b, rac-13, and rac-15 were studied for their in vitro efficacy regarding serotonin, noradrenaline, and dopamine reuptake inhibition using the corresponding hydrochlorides. The monoamine reuptake inhibition profiles of rac-12a, rac-12b, rac-13, and rac15 were generated via radioligand transporter assays using recombinant human monoamine transporter proteins. The data represent the mean of duplicate analyses. The studies were performed by Amedis Pharmaceuticals Ltd., Cambridge.

As can be seen from Figure 2, sila-substitution of $r a c-12 a(\rightarrow r a c-12 b) ~ s u b s t a n t i a l l y ~ a f f e c t s ~$ the pharmacological profile with respect to serotonin reuptake inhibition. The other (major) structural changes in the molecular shape of rac-12b ( $\rightarrow$ rac-13, rac-15) also influenced the pharmacological profile with respect to monoamine selectivity (rac-13) and/or absolute potency (rac-15). These results clearly demonstrate that the carbon/silicon switch strategy is a powerful tool for drug design.

Figure 2. In vitro efficacy of compounds rac-12a, rac-12b, rac-13, and rac-15 regarding serotonin, noradrenaline, and dopamine reuptake inhibition (preliminary data). $\mathrm{pIC}_{50}$ denotes the negative decadic logarithm of the half-maximum effect concentration [M]; cf. Table 44 (Appendix B, p. 184).

### 9.2 Silicon-based allosteric modulators of muscarinic receptors

The allosteric effects of the test compounds 10, 11, 27-30, 32, 33, 35, 36, 39, 42, 45-50, rac51, rac-52, and 53 (tested as the hydrochloride $\mathbf{5 3} \cdot \mathrm{HCl}$ ) on $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ dissociation and $\left[{ }^{3} \mathrm{H}\right]$ NMS equilibrium binding were tested at muscarinic $\mathrm{M}_{2}$ receptors of porcine heart homogenates. ${ }^{66}$ The data were measured by Dr. Seraina Duda-Johner and Marc Albrecht, Universität Bonn.

$$
\mathrm{pEC} \mathrm{C}_{50} \square \mathrm{p} K_{\mathrm{A}} \bullet \mathrm{p} \mathrm{\alpha}
$$

Figure 3. $\mathrm{pEC}_{50, \mathrm{diss}}, \mathrm{p} K_{\mathrm{A}}$, and $\mathrm{p} \alpha$ values obtained from the interaction studies of the respective allosteric modulators 10, $\mathbf{1 1}, \mathbf{2 7 - 3 0}, \mathbf{3 2}, \mathbf{3 3}, \mathbf{3 5}, \mathbf{3 6}, \mathbf{3 9}, \mathbf{4 2}, \mathbf{4 5}-\mathbf{5 0}$, rac-51, rac-52, and $\mathbf{5 3}$ (tested as the hydrochloride $\mathbf{5 3} \cdot \mathrm{HCl}$ ) with $\left.{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ at muscarinic $\mathrm{M}_{2}$ receptors of porcine heart homogenates. For further data, see Table 45 (Appendix B, p. 184). The order of the compounds reflects the order in Chart 3, and the data for W84 (11) was included for comparison.

The apparent rate constant $k_{-1}$ of $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ dissociation was reduced concentrationdependently by the test compounds. The inflection points of the resulting concentration-effect curves ( $\mathrm{EC}_{50 \text {,diss }}$ value) is a measure of the allosteric potency of the respective test compounds (for concentration-effect curves, see refs. 13 and 43 ). $\mathrm{EC}_{50, \text { diss }}$ corresponds to a $50 \%$ occupancy of the $\left[{ }^{3} \mathrm{H}\right]$ NMS-occupied receptor by the test compound and denotes the dissociation constant of allosteric agent binding to a ligand-occupied receptor; thus, the $\mathrm{pEC}_{50 \text {,diss }}$ values are a measure for the binding affinity of the allosteric test compounds to $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$-occupied receptors. ${ }^{41 \mathrm{~m}}$ The Hill coefficient $n_{\mathrm{H}}$, characterizing the slope of the concentration-effect curves, was significantly different from -1 for compounds $\mathbf{2 7}, \mathbf{2 8}, \mathbf{3 2}, \mathbf{3 3}$, and rac-51. This may point to a different way of
interaction of these silicon compounds with muscarinic acetylcholine receptors compared to the modulators of the W84-diaminium type ("11-type").

Equilibrium binding experiments provide the factor of cooperativity ( $\alpha$ ) between the respective modulator and $\left[{ }^{3} \mathrm{H}\right]$ NMS and the binding constant $\mathrm{p} K_{\mathrm{A}}$ for allosteric modulator binding to ligand-free receptors. $\mathrm{p} \alpha>0$ indicates a positive cooperativity (i.e., enhancement of $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ equilibrium binding) and vice versa. The allosteric modulator W 84 (11) reduced $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ equilibrium binding, indicating a negative cooperativity ( $\mathrm{p} \alpha=-0.51$ ). This result is in agreement with data published previously. ${ }^{411}$ In contrast, most of the silicon-based allosteric modulators increased $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ equilibrium binding, which reflects positive cooperativity. Thus, the SAR studies based on the availability of the broad range of structural variations of the silicon-based allosteric modulators synthesized within this work clearly demonstrate that a positive cooperativity is a very common characteristic of the allosteric action of the silicon-based allosteric modulators. This positive cooperativity is found to be most pronounced for compounds 27, 28, and 32, all of which bear 1,8 -naphthalimido moieties. This high positive cooperativity can (in the case of $\mathbf{2 8}$ and 32) be ascribed to the low affinity of these compounds for ligand-free receptors (low $\mathrm{p} K_{\mathrm{A}}$ value), whereas the only negative cooperativities were found for 46 and 48 , both bearing succinimido moieties.

The development of allosteric modulators which increase binding of the endogenous ligand acetylcholine is a primary aim, hence, the different mode of action of the silicon-based allosteric modulators with $\left[{ }^{3} \mathrm{H}\right]$ NMS at muscarinic $\mathrm{M}_{2}$ receptors (frequent pattern: positive cooperativity) compared to modulators of the W84-diaminium type (frequent pattern: negative cooperativity) points to a novel lead structure, in which one of the positive ammonium centers of W84 is replaced by a hydrophobic electrostatically neutral group. This novel lead structure of the "11-type" may exhibit the desired mode of interaction (positive cooperativity) with acetylcholine at certain muscarinic receptor subtypes. ${ }^{67}$

## 10 The performance of the Si-2,4,6-trimethoxyphenyl moiety as a novel protecting group in organosilicon chemistry

### 10.1 Discussion

The selectivity problems which were encountered in context with the work on the synthesis of the sila-venlafaxine derivative rac-14 in the reactions of 70-72 with $\mathbf{5 8}$ (twofold substitution of the alkoxy groups by organic moieties to give 73) lead to the development of the Si-2,4,6trimethoxyphenyl (Si-2,4,6-TMOP) moiety as a novel protecting group in organosilicon chemistry, which in turn was used for developing an alternative synthesis of rac-sila-venlafaxine (rac-12b), chlorotris(chloromethyl)silane (23), and tris(chloromethyl)methoxysilane (24).

rac-14

58

$\mathrm{R}=\mathrm{Me}: 70$
$\mathrm{R}=$ ' Pr : 71
$\mathrm{R}={ }^{\mathrm{t}} \mathrm{Bu}: \mathbf{7 2}$

73

The use of the Si-2,4,6-TMOP moiety as a protecing group in silacyclobutane chemistry is of special interest: (i) (2,4,6-Trimethoxyphenyl)lithium reacts selectively (monosubstitution) with 1,1-dichloro-1-silacyclobutane to give 74 after treatment with methanol. (ii) The presence of the bulky Si-2,4,6-TMOP group does not render the Si-methoxy group in compound $\mathbf{7 4}$ unreactive, thus allowing the transformation $74 \rightarrow$ 75. (iii) Most importantly, the Si-2,4,6-TMOP group can be cleaved selectively with hydrogen chloride from the silacyclobutane ring (transformation $\mathbf{7 5} \rightarrow \mathbf{7 6}$ ) without any other $\mathrm{Si}-\mathrm{C}$ bond cleavage. This is especially remarkable as numerous $\mathrm{Si}-\mathrm{C}$ bond cleavage reactions with hydrogen chloride, leading to ring opening of the silacyclobutane backbone, have been reported in the literature. ${ }^{68}$

74

75

76

In context with the synthesis of rac-sila-venlafaxine ( $\mathrm{rac-12b}$ ), the synthetic route using the Si-2,4,6-TMOP group as shown in Scheme 2 (p. 13, Section 3.1.2) has several advantages over the "conventional" way as shown in Scheme 1 (p. 11, Section 3.1.1), since (i) it can be carried out in
three steps instead of four (starting from 1,1-dichloro-1-silacyclohexane), (ii) it avoids the use of toxic and volatile iodomethane, which was used for the workup of 59, and (iii) it avoids the preparation of a dangerous intermediate, such as the hydridosilane $\mathbf{6 0}$.

59

60

The reaction conditions which were used to remove the Si-2,4,6-TMOP group (reaction $\mathbf{6 2} \rightarrow$ 63) were remarkably mild (room temperature, only a tiny excess of HCl ) to give an $\mathrm{Si}-\mathrm{Cl}$ group, the only detectable by-product being 1,3,5-trimethoxybenzene. Since the 1,3,5-trimethoxybenzene formed is inert to many reagents, further transformations of the resulting chlorosilane are possible without isolation of the intermediate chlorosilane, which was demonstrated by the direct transformation $62 \rightarrow r a c-12 b$ (no isolation of $\mathbf{6 3}$ ). In addition, the by-product 1,3,5trimethoxybenzene could be removed very easily from rac-12b by washing an aqueous solution of rac-12b with diethyl ether at an acidic pH value.

rac-12b

62

63

As stated above, the $\mathrm{Si}-2,4,6-\mathrm{TMOP}$ group was also applied to the synthesis of chlorotris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24) via 103.

In these syntheses, the reaction conditions used to remove the Si-2,4,6-trimethoxyphenyl group again were remarkably mild (room temperature, HCl or $\mathrm{MeOH} /\left[\mathrm{CF}_{3} \mathrm{C}(\mathrm{O}) \mathrm{OH}\right]$ ) to give $\mathrm{Si}-\mathrm{Cl}$ or $\mathrm{Si}-\mathrm{OMe}$ groups, the only detectable by-product being 1,3,5-trimethoxybenzene (same as in the synthesis of rac-12b via 62). The workup of 23 and 24 included twofold distillation (separation from the 1,3,5-trimethoxybenzene formed), and some product was lost during the distillation process to impure side fractions. This points at minor limitations of the Si-2,4,6-trimethoxyphenyl protecting group whenever isolation of a chloro- or methoxysilane is desired after cleavage of the Si-2,4,6-TMOP bond in case the respective chloro- or methoxysilane has a boiling point close to
that of 1,3,5-trimethoxybenzene; however, the direct further transformation of the resulting chloroor methoxysilane without isolation is an easy, fast, and effective way to circumvent this problem. This was demonstrated exemplarily by the transformation $\mathbf{6 2} \rightarrow$ rac- $\mathbf{1 2 b}$ in the sila-venlafaxine synthesis (see above).

In an attempt to prepare dichlorobis(chloromethyl)silane (25) using the Si-2,4,6-TMOP group, dichlorobis(2,4,6-trimethoxyphenyl)silane (104) was prepared. However, the further transfomation using $\mathrm{BrCH}_{2} \mathrm{Cl} / n$-Buli to give the intermediate $\mathbf{1 0 5}$ failed, which prevented the synthesis of $\mathbf{2 5}$ by this route.

Nevertheless, the preparation of $\mathbf{1 0 4}$ from tetrachlorosilane gave insight into the selectivity of the reaction of tetrachlorosilane with two molar equivalents of (2,4,6-trimethoxyphenyl)lithium. The reaction $\mathrm{SiCl}_{4} \rightarrow \mathbf{1 0 4}$ was shown to be highly selective by GC analysis. Apart from trace amounts of the monosubstitution product $\mathbf{1 0 2}$, compound 104 was the only detectable product. Since side reactions involving substitution of three or four chlorine atoms of the starting material tetrachlorosilane would lead to a unproportional high consumption of (2,4,6trimethoxyphenyl)lithium, and, hence, to the formation of significant amounts of $\mathbf{1 0 2}$ (which then would not find ( $2,4,6$-trimethoxyphenyl) lithium to react with), the experimentally established presence of only trace amounts of $\mathbf{1 0 2}$ unequivocally proves that this reaction is highly selective, even though the products of threefold or tetrafold substitution reactions (i.e., chlorotris( $2,4,6$ trimethoxyphenyl)silane and tetrakis(2,4,6-trimethoxyphenyl)silane) are unlikely to pass the GC column and, therefore, cannot be expected to be detectable by this method. ${ }^{69}$ On the other hand, when tetrachlorosilane was reacted with one molar equivalent of (2,4,6-trimethoxyphenyl)lithium, compound $\mathbf{1 0 2}$ was the main product, and $\mathbf{1 0 4}$ was detected only in traces (GC). Hence, the selectivities found for the reactions of tetrachlorosilane with one or two molar equivalents of ( $2,4,6$ trimethoxyphenyl)lithium demonstrate the high performance of the Si-2,4,6-TMOP chemistry.

### 10.2 Conclusions

The $S i-2,4,6-\mathrm{TMOP}$ moiety was demonstrated to be an effective protecting group for synthetic organosilicon chemistry. It fulfils all the major requirements that have been claimed to be necessary for a good protecting group: ${ }^{70}$ (i) The reagents for its introduction and cleavage are
commercially available; (ii) its introduction is easy and effective and does not lead to additional stereogenic centers; (iii) it is easy to characterize ( ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy); (iv) it is stable to a wide range of workup and reaction conditions including chromatography on silica gel; (v) it can be removed efficiently and selectively; and (vi) the by-product of the deprotection (1,3,5trimethoxybenzene) can be separated easily from the substrate.

In addition to the above-mentioned profile, (vii) (2,4,6-trimethoxyphenyl)silanes exhibit a high tendency for crystallization, making their isolation, purification, and characterization (crystal structure analysis) very easy, and (viii) they have low UV detection limits.

The Si-C cleavage of the Si-2,4,6-TMOP moiety has been demonstrated to occur with hydrogen chloride in diethyl ether at $0{ }^{\circ} \mathrm{C}$, without use of any catalyst (such as $\mathrm{AlCl}_{3}$ ), to yield a chlorosilane. The $S i$-allyl group and other $S i$-aryl moieties have also been reported to be removable by Si-C cleavage; however, these cleavage reactions have been accomplished with triflic acid ${ }^{8,71}$ or trifluoroacetic acid ${ }^{72}$.Thus, the easily and selectively removable $\mathrm{Si}-2,4,6$-TMOP group complements the toolbox of protecting groups in organosilicon chemistry that can be removed by acid-induced Si-C cleavage.

## 11 Results of the single-crystal X-ray diffraction studies

Compounds rac-12b $\cdot \mathrm{HCl},(R)-\mathbf{1 2 b} \cdot \mathrm{HBr}, r a c-13, r a c-15, r a c-15 \cdot \mathrm{HCl}, \mathbf{2 1 a}, 21 \mathbf{b}, 22 \mathrm{~b}, \mathbf{6 1}, 62$, $74,75,89,99,103,104,145 \cdot 2 \mathrm{H}_{2} \mathrm{O}$, and 146 were structurally characterized by single-crystal X-ray diffraction. ${ }^{73}$ The crystal data and experimental parameters used for these studies are given in Appendix A. The structures were solved by direct methods. ${ }^{74}$ All non-hydrogen atoms were refined anisotropically. ${ }^{75}$ The $\mathrm{NH}, \mathrm{COH}$, and HOH hydrogen atoms were localized in difference Fourier syntheses and refined freely. A riding model was employed in the refinement of the CH and SiOH hydrogen atoms. All bond lengths and angles which are not discussed explicitly in the following sections are in the expected range and therefore do not need further discussion.

## 11.1 rac-Sila-venlafaxine hydrochloride (rac-12b•HCI)

Suitable single crystals of rac- $\mathbf{1 2 b} \cdot \mathrm{HCl}$ were obtained by cooling of a boiling saturated solution of $\mathbf{r a c} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ in dichloromethane to $4^{\circ} \mathrm{C}$. Compound rac- $\mathbf{1 2 b} \cdot \mathrm{HCl}$ crystallizes in the space group $\mathrm{Pca2}_{1}$. As would be expected, the silacyclohexane skeleton in $\mathrm{rac} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ adopts a chair conformation (Figure 4). The structure is characterized by a relatively long $\mathrm{Si}-\mathrm{C} 6$ distance (1.9041 (14) $\AA)$, the reason for this elongation being unclear. Similar structural features are observed

Figure 4. Structure of the cation of rac- $\mathbf{1 2 b} \cdot \mathrm{HCl}$ in the crystal (only one enantiomer depicted; probability level of displacement ellipsoids 50\%). Selected bond distances ( $\AA$ ) and angles (deg): Si-O1 1.6286(12), Si-C1 1.8549(14), SiC5 1.8610(14), Si-C6 1.9041(14), C1-C2 1.539(2), C2-C3 1.529(2), C3-C4 1.526(2), C4-C5 1.5386(19), O1-Si-C1 106.38(7), O1-Si-C5 110.98(7), O1-Si-C6 111.08(6), C1-Si-C5 104.93(7), C1-Si-C6 111.31(7), C5-Si-C6 111.88(6), Si-C1-C2 110.46(10), C1-C2-C3 113.04(12), C2-C3-C4 113.91(13), C3-C4-C5 113.23(12), C4-C5-Si 110.38(10).
for the $\mathrm{Si}-\mathrm{C} 6$ (Si-C5) distances in the range $1.8931(15)$ to $1.909(3) \AA$ in the molecular structures of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}, \mathrm{rac}-\mathbf{1 3}, \mathrm{rac}-\mathbf{1 5}$, and $\mathrm{rac}-\mathbf{1 5} \cdot \mathrm{HCl}$. Interestingly, the corresponding C-C distance in $(S)$ $\mathbf{1 2 a} \cdot \mathrm{HBr}$ is less elongated $(1.56 \AA),{ }^{15 \mathrm{c}}$ indicating that the steric demand of the equatorial 2 -(dimethylammonio)- or 2-(dimethylamino)-1-(4-methoxyphenyl)ethyl substituent is not responsible for the long Si-C6 (Si-C5) distances observed for rac-12b $\cdot \mathrm{HCl},(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}, r a c-\mathbf{1 3}, r a c-\mathbf{1 5}$, and rac-15. HCl .

The crystal structure of rac- $\mathbf{1 2 b} \cdot \mathrm{HCl}$ is governed by hydrogen bonds. ${ }^{76}$ Compound rac$\mathbf{1 2 b} \cdot \mathrm{HCl}$ forms $\mathrm{O} 1-\mathrm{HO} \cdots \mathrm{Cl}$ and $\mathrm{N}-\mathrm{H} N \cdots \mathrm{Cl}$ hydrogen bonds, leading to the formation of infinite chains along [ $\left.\begin{array}{lll}0 & 0 & 1\end{array}\right]$ (Figure 5). These chains are built up by the ammonium cations and chloride anions, the absolute configurations of all the cations in a given chain being identical.

Figure 5. Hydrogen-bonding system in the crystal of rac-12b•HCl . Selected distances ( $\AA$ ) and angles (deg): O1-HO $0.84, \mathrm{H} O \cdots \mathrm{Cl} 2.34, \mathrm{Ol} \cdots \mathrm{Cl} 3.1246(13), \mathrm{O} 1-\mathrm{H} O \cdots \mathrm{Cl} 156, \mathrm{~N} \cdots \mathrm{H} N 0.863(18), \mathrm{H} N \cdots \mathrm{Cl} 2.305(17), \mathrm{N} \cdots \mathrm{Cl} 3.0680(13), \mathrm{N}-$ $\mathrm{H} N \cdots \mathrm{Cl} 147.5(14) .{ }^{76}$ The hydrogen atoms (except for the $\mathrm{H} O$ and $\mathrm{H} N$ atoms) are omitted for clarity.

Figure 6 shows a superposition of the cyclohexane skeleton of $(S) \mathbf{- 1 2 a} \cdot \mathrm{HBr}^{15 \mathrm{c}}$ and the 1 silacyclohexane skeleton of the $(S)$-enantiomer of $\mathbf{r a c} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$. Due to the longer covalent radius of the silicon atom, the 1 -silacyclohexane ring is more "flattened" than the cyclohexane ring. As a further consequence, the OH group and the ammonio moiety of the $\mathrm{C} / \mathrm{Si}$ analogs differ in their relative orientation. These structural features might be important for the ligand-receptor interactions of the venlafaxine and sila-venlafaxine enantiomers.

Figure 6. Superposition of the cyclohexane skeleton of $(S) \mathbf{- 1 2 a} \cdot \mathrm{HBr}$ and the 1 -silacyclohexane skeleton of the $(S)$ enantiomer of $\mathrm{rac} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$. The hydrogen atoms are omitted for clarity.

## 11.2 ( $R$ )-Sila-venlafaxine hydrobromide ( $(R)-12 \mathrm{~b} \cdot \mathrm{HBr})$

Suitable single crystals of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ crystallizes in the space group $P 2_{1}$. Similar to $\mathbf{r a c} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$, the silacyclohexane skeleton of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ adopts a chair conformation, and the $\mathrm{Si}-\mathrm{C} 6$ bond is elongated significantly (1.909(3) $\AA$ ) (Figure 7).

Figure 7. Structure of the cation of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ in the crystal (probability level of displacement ellipsoids $50 \%$ ). Selected bond distances ( $\AA$ ) and angles (deg): Si-O1 1.637(3), Si-C1 1.845(3), Si-C5 1.854(3), Si-C6 1.909(3), C1-C2 $1.534(5), \mathrm{C} 2-\mathrm{C} 31.510(6), \mathrm{C} 3-\mathrm{C} 41.506(7), \mathrm{C} 4-\mathrm{C} 51.525(5)$, O1-Si-C1 111.38(15), O1-Si-C5 106.75(16), O1-Si-C6 109.18(12), C1-Si-C5 104.72(16), C1-Si-C6 109.49(15), C5-Si-C6 115.26(13), Si-C1-C2 110.3(3), C1-C2-C3 113.6(3), C2-C3-C4 115.1(3), C3-C4-C5 114.0(4), C4-C5-Si 110.1(2).

Figure 8. Hydrogen-bonding system in the crystal of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$. Selected distances ( $\AA$ ) and angles (deg): $\mathrm{O} 1-\mathrm{HO}$ $0.84, \mathrm{H} O \cdots \mathrm{Br} 2.48, \mathrm{O} 1 \cdots \mathrm{Br} 3.261(2), \mathrm{O} 1-\mathrm{H} O \cdots \mathrm{Br} 154, \mathrm{~N} \cdots \mathrm{H} N 0.89(4), \mathrm{H} N \cdots \mathrm{Br} 2.48(4), \mathrm{N} \cdots \mathrm{Br} 3.290(3), \mathrm{N}-\mathrm{H} N \cdots \mathrm{Br}$ $151(2) .^{76}$ The hydrogen atoms (except for the $\mathrm{H} O$ and $\mathrm{H} N$ atoms) are omitted for clarity.

The absolute configuration of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ was reliably determined by refinement of the Flack parameter, leading to a value of $0.000(7)$ for the reported structure and to a value of 1.018 (7) for the inverted structure and thus revealing sufficiently strong inversion distinguishing power of the dataset. ${ }^{77}$

Compound $(R) \mathbf{- 1 2 b}$ forms $\mathrm{O} 1-\mathrm{HO} \cdots \mathrm{Br}$ and $\mathrm{N}-\mathrm{H} N \cdots \mathrm{Br}$ hydrogen bonds that lead to infinite chains of the ammonium cations and bromide anions along [010] (Figure 8).

## 11.3 rac-1-[2-(Dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclopentan-1-ol (rac-13)

Single crystals of rac-13 were grown by cooling of a solution of rac-13 ( 934 mg ) in $n$-pentane $(3 \mathrm{~mL})$ to $4^{\circ} \mathrm{C}$. Compound rac- $\mathbf{1 3}$ crystallizes in the space group $P 2_{1} / \mathrm{c}$. The silacyclopentane ring in rac-13 adopts two different envelope conformations (disorder of the carbon atoms C 2 and C 3 ), with occupancy factors of 0.76 and 0.24 , and the silacyclopentane skeleton shows some significant deviations from the tetrahedral angle, which is most pronounced for the angle C1-Si-C4 (96.22(10) deg). Similar to $\mathrm{rac} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$, the $\mathrm{Si}-\mathrm{C} 5$ bond of $\mathrm{rac}-\mathbf{1 3}$ (corresponding to the $\mathrm{Si}-\mathrm{C} 6$ bond in compound $\mathrm{rac} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ ) is elongated significantly (1.9056(13) $\AA$ ) (Figure 9).

Figure 9. Molecular structure of rac-13 in the crystal (only one enantiomer depicted; probability level of displacement ellipsoids $50 \%$ ). Due to the presence of two different envelope conformations of the silacyclopentane ring, the crystal structure of rac-13 is characterized by a disorder. The structure shown represents the dominating conformer (occupancy $76 \%$ ). Selected bond distances ( $\AA$ ) and angles (deg): Si-O1 1.6286(11), Si-C1 1.8834(18), Si-C4 1.8683(17), Si-C5 $1.9056(13), \mathrm{C} 1-\mathrm{C} 21.552(5), \mathrm{C} 2-\mathrm{C} 31.530(6), \mathrm{C} 3-\mathrm{C} 41.503(4), \mathrm{O} 1-\mathrm{Si}-\mathrm{C} 1109.30(7)$, $\mathrm{O} 1-\mathrm{Si}-\mathrm{C} 4115.45(7)$, $\mathrm{O} 1-\mathrm{Si}-\mathrm{C} 5$ $108.39(6), \mathrm{C} 1-\mathrm{Si}-\mathrm{C} 496.22(10), \mathrm{C} 1-\mathrm{Si}-\mathrm{C} 5114.37(7), \mathrm{C} 4-\mathrm{Si}-\mathrm{C} 5112.83(7), \mathrm{Si}-\mathrm{C} 1-\mathrm{C} 2101.9(3), \mathrm{C} 1-\mathrm{C} 2-\mathrm{C} 3109.5(3)$, C2-C3-C4 107.9(3), C3-C4-Si 104.30(19).

Compound rac-13 forms intermolecular $\mathrm{O} 1-\mathrm{HO} \cdots \mathrm{N}$ hydrogen bonds, leading to the formation of centrosymmetric dimers (Figure 10).

Figure 10. Hydrogen-bonding system in the crystal of rac-13 (dominating conformer). Selected distances ( $\AA$ ) and angles (deg): $\mathrm{O} 1-\mathrm{HO} 0.84, \mathrm{HO} \cdots \mathrm{N} 1.90, \mathrm{O} \cdots \mathrm{N} 2.7338(16), \mathrm{O} 1-\mathrm{H} O \cdots \mathrm{~N} 169{ }^{76}$ The hydrogen atoms (except for the $\mathrm{H} O$ atoms) are omitted for clarity.

## 11.4 rac-Desmethoxy-sila-venlafaxine (rac-1-[2-(dimethylamino)-1-phenyl-ethyl]-1-silacyclohexan-1-ol, rac-15)

Suitable single crystals of rac-15 were obtained directly from the preparation of this compound (see Experimental Section). Compound rac-15 crystallizes in the space group $P 2_{1} / n$. The asymmetric unit contains two molecules (A and B), with very similar structures (Figure 11). Similar to $\mathrm{rac} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$, the silacyclohexane skeleton of $\mathrm{rac}-\mathbf{1 5}$ adopts a chair conformation, and the $\mathrm{Si}-\mathrm{C} 6$ (Si-C26) bond is elongated significantly (molecule A, 1.8931(15) $\AA$; molecule B, 1.8988(15) $\AA$ ).

Figure 11. Structure of rac-15 in the crystal (only one enantiomer of molecules A and B depicted; probability level of displacement ellipsoids $50 \%$; the depiction does not reflect the relative orientation of molecules A and B in the crystal). Selected bond distances $(\AA)$ and angles (deg); data for molecule A: Si1-O1 1.6200(11), Si1-C1 1.8655(17), Si1-C5 1.8608(16), Si1-C6 1.8931(15), C1-C2 1.529(2), C2-C3 1.524(2), C3-C4 1.519(2), C4-C5 1.533(2), O1-Si1-C1 113.78(7), O1-Si1-C5 115.47(7), O1-Si1-C6 105.45(6), C1-Si1-C5 103.76(7), C1-Si1-C6 109.26(7), C5-Si1-C6 109.03(7), Si1-C1-C2 110.99(11), C1-C2-C3 113.03(15), C2-C3-C4 114.65(15), C3-C4-C5 113.42(15), C4-C5-Si1 110.50(11). Data for molecule B (the atoms are labelled by adding " 20 " to the label number of the corresponding atoms in molecule A): Si21-O21 1.6259(12), Si21-C21 1.8609(16), Si21-C25 1.8560(18), Si21-C26 1.8988(15), C21-C22 1.528(2), C22-C23 1.518(3), C23-C24 1.515(3), C24-C25 1.536(3), O21-Si21-C21 111.95(7), O21-Si21-C25 113.66(8), O21-Si21-C26 108.25(7), C21-Si21-C25 103.91(8), C21-Si21-C26 109.09(7), C25-Si21-C26 109.87(7), Si21-C21-C22 112.40(12), C21-C22-C23 113.44(15), C22-C23-C24 114.22(16), C23-C24-C25 112.50(15), C24-C25-Si21 111.13(13).

In contrast to the closely related compounds rac- $\mathbf{1 2 b} \cdot \mathrm{HCl},(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$, and rac-13, the silanol OH group occupies an equatorial position of the silacyclohexane skeleton of rac-15 in the crystal, which also applies to the corresponding hydrochloride rac-15. HCl (see below).

The crystal structure of rac-15 is governed by hydrogen bonds. ${ }^{76}$ Compound rac-15 forms intermolecular $\mathrm{O} 1-\mathrm{HOl} \cdots \mathrm{N} 21$ and $\mathrm{O} 21-\mathrm{HO} 21 \cdots \mathrm{~N} 1$ hydrogen bonds that lead to infinite chains of the molecules along [ $\left.\begin{array}{lll}1 & 0 & 0\end{array}\right]$ (Figure 12). These chains are built up by molecules $A$ and $B$ in an alternating manner ( $\cdots \mathrm{A} \cdots \mathrm{B} \cdots \mathrm{A} \cdots \mathrm{B} \cdots)$, the absolute configurations of A and B in a given chain being opposite.

Figure 12. Hydrogen-bonding system in the crystal of rac-15. Selected distances ( $\AA$ ) and angles (deg): O1-HO1 0.84, $\mathrm{HO} 1 \cdots \mathrm{~N} 211.91, \mathrm{O} 1 \cdots \mathrm{~N} 212.6996(18), \mathrm{O} 1-\mathrm{HO} 1 \cdots \mathrm{~N} 157$; O21-HO21 $0.84, \mathrm{HO} 21 \cdots \mathrm{~N} 11.95, \mathrm{O} 21 \cdots \mathrm{~N} 12.7878(17)$, $\mathrm{O} 21-\mathrm{HO} 21 \cdots \mathrm{~N} 1175 .{ }^{76}$ The hydrogen atoms (except for the HOl and HO 21 atoms) are omitted for clarity.

## 11.5 rac-Desmethoxy-sila-venlafaxine hydrochloride (rac-[2-(1-hydroxy-1-sila-1-cyclohexyl)-2-phenylethyl]dimethylammonium chloride, rac$15 . \mathrm{HCl})$

Suitable single crystals of rac- $\mathbf{1 5} \cdot \mathrm{HCl}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound rac- $\mathbf{1 5} \cdot \mathrm{HCl}$ crystallizes in the space group $P 2_{1} / n$. Similar structural features as discussed for rac-15 apply, with the silacyclohexane ring adopting a chair conformation, the Si-C6 bond being elongated significantly (1.9041(14) $\AA$ ), and the silanol OH group being in an equatorial position (Figure 13).

The crystal structure of $\mathrm{rac}-\mathbf{1 5} \cdot \mathrm{HCl}$ is governed by hydrogen bonds. ${ }^{76}$ Compound rac-15•HCl forms $\mathrm{O}-\mathrm{HO} \cdots \mathrm{Cl}$ and $\mathrm{N}-\mathrm{H} N \cdots \mathrm{Cl}$ hydrogen bonds, leading to the formation of infinite chains along $\left[\begin{array}{lll}1 & 0 & 0\end{array}\right]$ (Figure 14). These chains are built up by the ammonium cations and chloride anions, the absolute configurations of all the cations in a given chain being identical.

Figure 13. Structure of the cation of rac- $\mathbf{1 5} \cdot \mathbf{H C l}$ in the crystal (only one enantiomer depicted). Selected bond distances ( $\AA$ ) and angles (deg): Si-O 1.6348(12), Si-C1 1.8602(15), Si-C5 1.8481(15), Si-C6 1.9041(14), C1-C2 1.537(2), C2C3 1.524(2), C3-C4 1.531(2), C4-C5 1.526(2), O-Si-C1 113.03(7), O-Si-C5 110.04(7), O-Si-C6 108.25(6), C1-SiC5 105.73(7), C1-Si-C6 108.34(7), C5-Si-C6 111.47(7), Si-C1-C2 111.57(10), C1-C2-C3 113.39(15), C2-C3-C4 114.23(13), C3-C4-C5 113.42(15), C4-C5-Si 110.93(11).

Figure 14. Hydrogen-bonding system in the crystal of rac-15•HCl. Selected distances ( $\AA$ ) and angles (deg): $\mathrm{O}-\mathrm{HO} 0.84$, $\mathrm{H} O \cdots \mathrm{Cl} 2.25, \mathrm{O} \cdots \mathrm{Cl} 3.0762(12), \mathrm{O}-\mathrm{H} O \cdots \mathrm{Cl} 170 ; \mathrm{N} \cdots \mathrm{H} N 0.929(18), \mathrm{H} N \cdots \mathrm{Cl} 2.119(18), \mathrm{N} \cdots \mathrm{Cl} 3.0444(13), \mathrm{N}-\mathrm{H} N \cdots \mathrm{Cl}$ $173.8(15) .{ }^{76}$ The hydrogen atoms (except for the HO and $\mathrm{H} N$ atoms) are omitted for clarity.

### 11.6 Bexarotene (21a)

Suitable single crystals of $\mathbf{2 1 a}\left(\mathrm{mp} 224-225{ }^{\circ} \mathrm{C}\right.$ ) were obtained by crystallization from a solution of 21a $(130 \mathrm{mg})$ in dichloromethane ( 5 mL ) (slow evaporation of the solvent at $20^{\circ} \mathrm{C}$ ). Compound 21a crystallizes in the space group $P \overline{1}$ and forms intermolecular $\mathrm{O} 2-\mathrm{H} 2 \cdots \mathrm{O} 1 \mathrm{~A}$ hydrogen bonds in the crystal, leading to the formation of centrosymmetric dimers (Figure 15).

Figure 15. Centrosymmetric dimer in the crystal of 21a (probability level of displacement ellipsoids 50\%). Selected bond distances ( $\AA$ ) and angles (deg) and selected torsion angles (deg): C01-C1 1.5331(18), C01-C2 1.5332(19), C01C3 1.5407(16), C01-C8 1.5380(15), C02-C4 1.5367(18), C02-C5 1.532(2), C02-C6 1.5347(18), C02-C7 1.5281(16), C3-C4 1.5170(18), C7-C8 1.4005(15), C1-C01-C2 109.05(10), C1-C01-C3 107.85(10), C1-C01-C8 109.18(10), C2-C01-C3 109.28(11), C2-C01-C8 110.27(10), C3-C01-C8 111.16(9), C4-C02-C5 111.44(10), C4-C02-C6 107.28(12), C4-C02-C7 108.79(9), C5-C02-C6 108.38(11), C5-C02-C7 109.37(11), C6-C02-C7 111.60(10), C01-C3-C4 112.70(10), C01-C8-C7 123.39(10), C02-C4-C3 111.57(11), C02-C7-C8 122.67(10), C01-C3-C4-C02 64.15(15), C01-C8-C7-C02 6.08(19), C3-C01-C8-C7 2.63(17), C8-C01-C3-C4 -36.55(15), C4-C02-C7-C8 18.69(16), C7-C02-C4-C3 -52.40(14), C9-C10-C14-C15 51.66(19), C9-C10-C14-C16 -126.74(13), C10-C14-C16-C17 26.45(17). Data for the hydrogen-bonding system: ${ }^{.76} \mathrm{O} 2-\mathrm{H} 2 \quad 0.89(2), \mathrm{H} 2 \cdots \mathrm{O} 1 \mathrm{~A} 1.772(19)$, O2 $\cdots \mathrm{O} 1 \mathrm{~A}$ 2.6593(15), O2-H2‥O1A 176(2).

### 11.7 Disila-bexarotene (21b)

Suitable single crystals of $\mathbf{2 1 b}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound 21b crystallizes in the space group $P \overline{1}$ and forms

Figure 16. Centrosymmetric dimer in the crystal of 21b (probability level of displacement ellipsoids 50\%). Selected bond distances ( $\AA$ ) and angles (deg) and selected torsion angles (deg): Si1-C1 1.8665(15), Si1-C2 1.8706(15), Si1-C3 $1.8735(14)$, Si1-C8 1.8877(14), Si2-C4 1.8752(16), Si2-C5 1.8640(17), Si2-C6 1.8711(17), Si2-C7 1.8863(14), C3C4 1.548(2), C7-C8 1.4145(17), C1-Si1-C2 109.49(7), C1-Si1-C3 109.32(7), C1-Si1-C8 108.49(6), C2-Si1-C3 110.39(7), C2-Si1-C8 109.59(7), C3-Si1-C8 109.53(6), C4-Si2-C5 110.23(8), C4-Si2-C6 110.38(8), C4-Si2-C7 108.04(6), C5-Si2-C6 109.30(9), C5-Si2-C7 110.58(7), C6-Si2-C7 108.28(8), Si1-C3-C4 112.09(9), Si1-C8-C7 124.53(9), Si2-C4-C3 111.65(10), Si2-C7-C8 122.54(10), Si1-C3-C4-Si2-65.85(12), Si1-C8-C7-Si2 1.09(16), C3-Si1-C8-C7-7.41(13), C8-Si1-C3-C4 42.37(13), C4-Si2-C7-C8-18.21(13), C7-Si2-C4-C3 53.34(11), C9-C10-C14-C15-92.78(16), C9-C10-C14-C16 86.41(14), C10-C14-C16-C17 23.62(17). Data for the hydrogen-bonding system: ${ }^{76} \mathrm{O} 2-\mathrm{H} 20.83(2), \mathrm{H} 2 \cdots \mathrm{O} 1 \mathrm{~A} 1.83(2), \mathrm{O} 2 \cdots \mathrm{O} 1 \mathrm{~A} 2.6582(16), \mathrm{O} 2-\mathrm{H} 2 \cdots \mathrm{O} 1 \mathrm{~A} 174(2)$.
intermolecular $\mathrm{O} 2-\mathrm{H} 2 \cdots \mathrm{O} 1 \mathrm{~A}$ hydrogen bonds in the crystal, leading to the formation of centrosymmetric dimers (Figure 16).

As can be seen from the figure legends of Figures $16,18,23$, and 24 , the conformations of the 5,8-disila-5,6,7,8-tetrahydronaphthalene skeletons of $\mathbf{2 1 b}, \mathbf{2 2 b}, \mathbf{8 9}$, and $\mathbf{9 9}$ are very similar, but differ significantly from the conformation of the $5,6,7,8$-tetrahydronaphthalene moiety of 21a (Figure 15). This is demonstrated in Figure 17 by the superposition of the respective partial structures of the $\mathrm{C} / \mathrm{Si}$ analogs 21a and 21b. These differences result from the different covalent radii of carbon and silicon.

Figure 17. Superposition of the 3,5,5,8,8-pentamethyl-5,6,7,8-tetrahydro-2-naphthyl group of 21a (dashed bonds) and the 3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl group of 21b (solid bonds). The hydrogen atoms are omitted for clarity.

As can be seen from Figures 15, 16, and 23 and from the torsion angles listed in the respective figure legends, the $\mathrm{sp}^{2}$-hybridized carbon atoms $\mathrm{C} 9, \mathrm{C} 10, \mathrm{C} 14, \mathrm{C} 15, \mathrm{C} 16$, and C 17 of 21a, 21b, and 89 are not localized in one plane, probably due to the steric requirements of the C13-methyl group. The different torsion angles $\mathrm{C} 9-\mathrm{C} 10-\mathrm{C} 14-\mathrm{C} 15, \mathrm{C} 9-\mathrm{C} 10-\mathrm{C} 14-\mathrm{C} 16$, and $\mathrm{C} 10-\mathrm{C} 14-\mathrm{C} 16-\mathrm{C} 17$ reflect the conformational flexibility of these compounds, which might be very important for receptor binding.

### 11.8 Disila-AG-045572 (22b)

Suitable single crystals of 22b were obtained by vapor diffusion of $n$-pentane into a solution of 22b $(100 \mathrm{mg})$ in diethyl ether $(30 \mathrm{~mL})$ (colorless plates, $\mathrm{mp} 158{ }^{\circ} \mathrm{C}$ ). ${ }^{78}$ Compound 22b crystallizes in the space group $C 2 / c$ and forms intermolecular $\mathrm{N}-\mathrm{H} \cdots \mathrm{O}$ hydrogen bonds in the crystal, leading to infinite chains along [llll 010$]$.

The $\mathrm{sp}^{2}$-hybridized atoms $\mathrm{C} 17, \mathrm{C} 18, \mathrm{C} 19$, and O 2 of $\mathbf{2 2 b}$ are not localized in one plane (C17-C18-C19-O2-162.8(2) deg), and the torsion angle C19-N-C20-C21 (64.9(2) deg) indicates that there is hardly any interaction of the lone pair of the nitrogen atom with the $\pi$ electrons of the
adjacent aromatic moiety. In contrast, the torsion angle C18-C19-N-C20 (177.08(15) deg) and the sum of bond angles around the nitrogen atom (ca. 359 deg ) indicate a high degree of interaction between the lone pair of the nitrogen atom and the carbonyl group. All these structural features might be of importance for the active conformation of $\mathbf{2 2 b}$ at the receptor.

As can be seen from the torsion angles listed in the figure legends of Figures 18 and 24, the conformations of the 3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl groups of 22b and 99 are rather similar. These conformations are also similar to that of the corresponding framework of disila-bexarotene (21b), but differ significantly from the conformation of the 3,5,5,8,8-pentamethyl-5,6,7,8-tetrahydro-2-naphthyl group of bexarotene (21a). ${ }^{79}$ This difference might be important for the receptor binding of the $\mathrm{C} / \mathrm{Si}$ analogs 22a and 22b.

Figure 18. Molecular structure of 22b in the crystal (probability level of displacement ellipsoids 50\%). Selected bond distances $(\AA)$ and angles (deg) and selected torsion angles (deg): Si1-C1 1.863(4), Si1-C2 1.853(4), Si1-C3 1.862(3), Si1-C8 1.879(2), Si2-C4 1.870(3), Si2-C5 1.852(3), Si2-C6 1.858(3), Si2-C7 1.8814(18), C3-C4 1.522(4), C7-C8 $1.408(3)$, C1-Si1-C2 109.0(2), C1-Si1-C3 110.04(18), C1-Si1-C8 109.96(14), C2-Si1-C3 110.51(16), C2-Si1-C8 108.82(13), C3-Si1-C8 108.50(12), C4-Si2-C5 109.54(16), C4-Si2-C6 110.81(16), C4-Si2-C7 108.33(11), C5-Si2C6 108.59(18), C5-Si2-C7 110.02(12), C6-Si2-C7 109.55(12), Si1-C3-C4 112.5(2), Si1-C8-C7 124.00(14), Si2-C4C3 112.69(19), Si2-C7-C8 123.54(14), Si1-C3-C4-Si2 65.8(3), Si1-C8-C7-Si2-1.8(3), C3-Si1-C8-C7 11.9(2), C8-Si1-C3-C4-47.2(3), C4-Si2-C7-C8 12.0(2), C7-Si2-C4-C3-47.4(3). Data for the hydrogen-bonding system: ${ }^{76} \mathrm{~N}-\mathrm{H}$ $0.845(19), \mathrm{H} \cdots \mathrm{O} 2 \mathrm{~A} 2.202(19), \mathrm{N} \cdots \mathrm{O} 2 \mathrm{~A} 3.029(2), \mathrm{N}-\mathrm{H} \cdots \mathrm{O} 2 \mathrm{~A} 166.2(18)$.

### 11.9 1-Methoxy-1-(2,4,6-trimethoxyphenyl)-1-silacyclohexane (61)

Suitable single crystals of $\mathbf{6 1}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound $\mathbf{6 1}$ crystallizes in the space group $P 2_{1} 2_{1} 2_{1}$. It exhibits an approximately tetrahedral coordination at the silicon atom, and silacyclohexane ring of $\mathbf{6 1}$ adopts a chair conformation (Figure 19). Compound 61 exhibits short intramolecular distances between the silicon atoms and the oxygen atoms in the ortho-methoxy groups. These $\mathrm{Si} \cdots \mathrm{O}$ distances are all shorter than the sum of the van der Waals radii of silicon ( $2.1 \AA$ ) and oxygen ( $1.5 \AA$ ) but significantly longer than a typical covalent $\mathrm{Si}-\mathrm{O}$ bond $(1.64 \AA)^{80}$ of a tetracoordinate silicon
compound. The Si-2,4,6-TMOP group exhibits one shorter and one longer $\mathrm{Si} \cdots \mathrm{O}$ contact ( $\mathrm{Si} \cdots \mathrm{O} 1$ $2.9001(16) \AA, \mathrm{Si} \cdots \mathrm{O} 3 \mathrm{3} 3189(15) \AA)$. Very similar results are observed for the $2,4,6-$ trimethoxyphenyl)silanes $\mathbf{6 2}, \mathbf{7 4}, \mathbf{7 5}, \mathbf{1 0 3}, \mathbf{1 0 4}$, and 146, with $\mathrm{Si} \cdots \mathrm{O}$ distances in the range 2.76-3.17 $\AA$, and have also been reported for a series of other (2,4,6-trimethoxyphenyl)silanes. ${ }^{40 \mathrm{e}}$

Figure 19. Molecular structure of $\mathbf{6 1}$ in the crystal (probability level of displacement ellipsoids $50 \%$ ). Selected bond distances ( $\AA$ ) and angles (deg): Si-C1 1.888(2), Si-C10 1.867(2), Si-C14 1.864(2), Si-O4 1.6509(14), $\mathrm{Si} \cdots \mathrm{O} 1$ 2.9001(16), Si $\cdots \mathrm{O} 3$ 3.1189(15), C1-Si-C10 111.92(10), C1-Si-C14 115.04(10), C1-Si-O4 110.07(8), C10-Si-C14 104.35(11), C10-Si-O4 110.54(9), C14-Si-O4 104.56(9).

### 11.10 1-[1-(4-Methoxyphenyl)vinyl]-1-(2,4,6-trimethoxyphenyl)-1silacyclohexane (62)

Suitable single crystals of 62 were obtained from an undercooled $\left(20^{\circ} \mathrm{C}\right)$ melt of this compound ( 1.3 g ) after addition of two drops of $n$-hexane; the resulting mixture was kept at $20^{\circ} \mathrm{C}$ for 16 h to afford colorless crystals ( $\mathrm{mp} 45-46^{\circ} \mathrm{C}$ ). Compound $\mathbf{6 2}$ crystallizes in the space group $P \overline{1}$. The asymmetric unit contains two molecules (A and B) with similar structures (Figure 20). Similar structural features as discussed for $\mathbf{6 1}$ apply, with the silacyclohexane ring adopting a chair conformation and the $\mathrm{Si} \cdots \mathrm{O}$ distances between the silicon atoms and the oxygen atoms in the orthomethoxy groups being smaller than the sum of the van der Waals radii of oxygen and silicon.

## Molecule B

Figure 20. Structure of $\mathbf{6 2}$ in the crystal (probability level of displacement ellipsoids $50 \%$; the depiction does not reflect the relative orientation of molecules A and B in the crystal). Selected interatomic distances ( $\AA$ ) and bond angles (deg); data for molecule A: Si1-C1 1.8838(19), Si1-C10 1.8890(19), Si1-C14 1.881(2), Si1-C15 1.8903(19), Si1…O1 2.9037(17), Si1‥O3 3.1249(15), C1-Si1-C10 110.62(9), C1-Si1-C14 113.44(9), C1-Si1-C15 111.16(8), C10-Si1C14 104.01(9), C10-Si1-C15 109.80(9), C14-Si1-C15 107.52(9). Data for molecule B (the atoms are labelled by adding " 30 " to the label number of the corresponding atoms in molecule A): Si31-C31 1.8942(18), Si31-C40 1.877(2), Si31-C44 1.8870(18), Si31-C45 1.8968(19), Si31‥O31 2.9125(17), Si31‥O33 3.1268(14), C31-Si31-C40 113.09(8), C31-Si31-C44 110.49(8), C31-Si31-C45 112.37(8), C40-Si31-C44 104.14(9), C40-Si31-C45 106.98(9), C44-Si31C45 109.39(8).

### 11.11 1-Methoxy-1-(2,4,6-trimethoxyphenyl)-1-silacyclobutane (74)

Suitable single crystals of $\mathbf{7 4}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound 74 crystallizes in the space group $P 2_{1} / n$. The Si coordination polyhedron of 74 is a strongly distorted tetrahedron (Figure 21). This distortion is forced by the geometry of the four-membered silacyclobutane ring, which adopts a butterfly

Figure 21. Molecular structure of 74 in the crystal (probability level of displacement ellipsoids 50\%). Selected interatomic distances ( $\AA$ ) and bond angles (deg): Si-C1 1.8678(17), Si-C10 1.873(2), Si-C12 1.8720(18), Si-O4 $1.6450(15), \mathrm{Si} \cdots \mathrm{C} 112.387(2), \mathrm{Si} \cdots \mathrm{O} 12.9339(14), \mathrm{Si} \cdots \mathrm{O} 3$ 3.0580(14), $\mathrm{C} 1-\mathrm{Si}-\mathrm{C} 10$ 116.95(9), $\mathrm{C} 1-\mathrm{Si}-\mathrm{C} 12$ 119.52(8), C1-Si-O4 110.13(8), C10-Si-C12 79.98(8), C10-Si-O4 116.07(9), C12-Si-O4 111.50(9).
conformation. The $\mathrm{Si} \cdots \mathrm{C} 11$ distance is remarkably short $(2.387(2) \AA)$, which also reflects the geometry that is forced by this butterfly conformation. Apart from the geometry of the silacyclobutane skeleton, similar structural features as discussed for $\mathbf{6 1}$ apply, with the $\mathrm{Si} \cdots \mathrm{O}$ distances between the silicon atom and the oxygen atoms in the ortho-methoxy groups being smaller than the sum of the van der Waals radii of oxygen and silicon.

### 11.12 1-[1-(4-Methoxyphenyl)vinyl]-1-(2,4,6-trimethoxyphenyl)-1silacyclobutane (75)

Suitable single crystals of $\mathbf{7 5}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound $\mathbf{7 5}$ crystallizes in the space group $P 2_{1} / n$. Similar structural features as discussed for $\mathbf{6 1}$ and 74 apply, with the silacyclohexane ring adopting a a butterfly conformation ( $\mathrm{Si} \cdots \mathrm{C} 11,2.4012(14) \AA$ ) and the $\mathrm{Si} \cdots \mathrm{O}$ distances between the silicon atom and the oxygen atoms in the ortho-methoxy groups being smaller than the sum of the van der Waals radii of oxygen and silicon.

Figure 22. Molecular structure of 75 in the crystal (probability level of displacement ellipsoids $50 \%$ ). Selected interatomic distances ( $\AA$ ) and bond angles (deg): Si-C1 1.8681(13), Si-C10 1.8829(14), Si-C12 1.8803(14), Si-C13 $1.8850(14), \mathrm{Si} \cdots \mathrm{C} 112.4012(14), \mathrm{Si} \cdots \mathrm{O} 12.9226(11), \mathrm{Si} \cdots \mathrm{O} 33.0136(10), \mathrm{C} 1-\mathrm{Si}-\mathrm{C} 10118.49(6), \mathrm{C} 1-\mathrm{Si}-\mathrm{C} 12$ 120.79(6), C1-Si-C13 109.26(6), C10-Si-C12 79.00(6), C10-Si-C13 115.73(6), C12-Si-C13 110.96(6).

### 11.13 Methyl 4-[1-(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2naphthyl)vinyl]benzoate (89)

Suitable single crystals of $\mathbf{8 9}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound $\mathbf{8 9}$ crystallizes in the space group $P 2_{1} / c$. For a discussion of structural features of $\mathbf{8 9}$, see Section 11.7 (p. 49).

Figure 23. Molecular structure of $\mathbf{8 9}$ in the crystal (probability level of displacement ellipsoids $50 \%$ ). Selected bond distances ( $\AA$ ) and angles (deg) and selected torsion angles (deg): Si1-C1 1.859(2), Si1-C2 1.869(2), Si1-C3 1.873(2), Si1-C8 1.8892(18), Si2-C4 1.875(2), Si2-C5 1.864(2), Si2-C6 1.865(2), Si2-C7 1.8874(19), C3-C4 1.544(3), C7-C8 1.411(3), C1-Si1-C2 108.77(11), C1-Si1-C3 110.82(10), C1-Si1-C8 107.96(9), C2-Si1-C3 108.86(11), C2-Si1-C8 112.67(9), C3-Si1-C8 107.77(9), C4-Si2-C5 108.27(9), C4-Si2-C6 112.11(11), C4-Si2-C7 110.28(9), C5-Si2-C6 109.38(11), C5-Si2-C7 109.70(9), C6-Si2-C7 107.07(9), Si1-C3-C4 111.66(15), Si1-C8-C7 121.27(13), Si2-C4-C3 114.03(13), Si2-C7-C8 125.11(13), Si1-C3-C4-Si2-61.61(18), Si1-C8-C7-Si2-5.2(2), C3-Si1-C8-C7-27.50(18), C8-Si1-C3-C4 56.99(15), C4-Si2-C7-C8-5.3(2), C7-Si2-C4-C3 35.26(19), C9-C10-C14-C15 62.3(3), C9-C10-C14-C16-114.2(2), C10-C14-C16-C17-155.64(18).

### 11.14 5-[(3,5,5,8,8-Pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methyl]-2-furoic acid (99)

Suitable single crystals of $\mathbf{9 9}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound 99 crystallizes in the space group $C 2 / c$ and forms

Figure 24. Centrosymmetric dimer in the crystal of $\mathbf{9 9}$ (probability level of displacement ellipsoids 50\%). Selected bond distances ( $\AA$ ) and angles (deg) and selected torsion angles (deg): Si1-C1 1.8696(15), Si1-C2 1.8696(17), Si1-C3 $1.8690(15)$, Si1-C8 1.8837(14), Si2-C4 1.8732(15), Si2-C5 1.8635(16), Si2-C6 1.8682(15), Si2-C7 1.8870(13), C3C4 1.544(2), C7-C8 1.4150(18), C1-Si1-C2 109.45(8), C1-Si1-C3 110.63(8), C1-Si1-C8 109.59(7), C2-Si1-C3 110.96(7), C2-Si1-C8 108.57(7), C3-Si1-C8 107.59(6), C4-Si2-C5 110.94(7), C4-Si2-C6 109.20(7), C4-Si2-C7 109.82(6), C5-Si2-C6 109.33(7), C5-Si2-C7 107.85(7), C6-Si2-C7 109.68(7), Si1-C3-C4 111.35(10), Si1-C8-C7 122.75(10), Si2-C4-C3 114.16(10), Si2-C7-C8 124.22(10), Si1-C3-C4-Si2 63.22(13), Si1-C8-C7-Si2 -0.43(17), C3-Si1-C8-C7 22.65(13), C8-Si1-C3-C4-55.45(11), C4-Si2-C7-C8 2.69(14), C7-Si2-C4-C3-36.48(13). Data for the hydrogen-bonding system: ${ }^{76} \mathrm{O} 3-\mathrm{H} 0.82(3), \mathrm{H} \cdots \mathrm{O} 2 \mathrm{~A} 1.84(3), \mathrm{O} 3 \cdots \mathrm{O} 2 \mathrm{~A} 2.6583(18), \mathrm{O} 3-\mathrm{H} \cdots \mathrm{O} 2 \mathrm{~A} 178(3)$.
intermolecular $\mathrm{O} 3-\mathrm{H} 3 \cdots \mathrm{O} 2 \mathrm{~A}$ hydrogen bonds in the crystal, leading to the formation of centrosymmetric dimers (Figure 24). For a discussion of structural features of 99, see Section 11.8 (p. 50).

### 11.15 Tris(chloromethyl)(2,4,6-trimethoxyphenyl)silane (103)

Suitable single crystals of $\mathbf{1 0 3}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound $\mathbf{1 0 3}$ crystallizes in the space group $P \overline{1}$. The $\mathrm{Si}-\mathrm{C} 12-$ $\mathrm{Cl} 31(\mathrm{Cl} 32)$ group in $\mathbf{1 0 3}$ adopts two different conformations (disorder of the chlorine atoms Cl 31 and Cl 32 ), with occupancy factors of 0.65 and 0.35 , respectively. The molecular structure is characterized by short intramolecular distances between the silicon atom and the oxygen atoms in the ortho-methoxy groups (Figure 25). These Si‥O distances amount to 2.8708(15) $\AA$ and $3.0679(14) \AA$, respectively, which parallels the findings for compounds $\mathbf{6 1}, \mathbf{6 2}, \mathbf{7 4}, \mathbf{7 5}, \mathbf{1 0 4}$, and 146, cf. Section 11.9 (p. 51).

Figure 25. Molecular structure of 103 in the crystal (probability level of displacement ellipsoids 50\%). Due to the presence of two different conformations of the $\mathrm{Si}-\mathrm{C} 12-\mathrm{Cl} 31(\mathrm{Cl} 32)$ group, the crystal structure of $\mathbf{1 0 3}$ is characterized by a disorder. The structure shown represents the dominating conformer (occupancy $65 \%$ ). Selected interatomic distances $(\AA)$ and bond angles (deg): Si-C1 1.854(2), Si-C10 1.8750(19), Si-C11 1.8735(19), Si-C12 1.876(2), C10Cl1 1.789(2), C11-Cl2 1.803(2), C12-Cl31 1.802(4), Si $\cdots \mathrm{O} 12.8708(15), \mathrm{Si} \cdots \mathrm{O} 33.0679(14), \mathrm{C} 1-\mathrm{Si}-\mathrm{C} 10113.46(9)$, C1-Si-C11 112.88(8), C1-Si-C12 110.51(10), C10-Si-C11 107.13(9), C10-Si-C12 104.40(9), C11-Si-C12 107.96(10), Si-C10-Cl1 111.08(10), Si-C11-C12 110.52(10), Si-C12-Cl31 111.42(14).

### 11.16 Dichlorobis(2,4,6-trimethoxyphenyl)silane (104)

Suitable single crystals of $\mathbf{1 0 4}$ were obtained directly from the preparation of this compound (see Experimental Section). Compound $\mathbf{1 0 4}$ crystallizes in the space group $C 2 / c$. The $\mathrm{Si}-$ coordination polyhedron of $\mathbf{1 0 4}$ is a strongly distorted tetrahedron (Figure 26), with the largest
angle at the silicon atom being observed for $\mathrm{C} 1-\mathrm{Si}-\mathrm{C} 10$ (117.62(6) deg) and the smallest for $\mathrm{Cl} 1-$ $\mathrm{Si}-\mathrm{Cl} 2$ (103.98(2) deg), thus clearly reflecting the different steric demands of the bulky Si-2,4,6TMOP groups and the smaller chlorine atoms attached to the silicon atom.

Similar to the closely related compounds $\mathbf{6 1}, \mathbf{6 2}, \mathbf{7 4}, \mathbf{7 5}, \mathbf{1 0 3}$, and $\mathbf{1 4 6}$, the molecular structure of $\mathbf{1 0 4}$ is characterized by short intramolecular distances between the silicon atom and the oxygen atoms in the ortho-methoxy groups. Within this series of crystal structures of analogous (2,4,6trimethoxyphenyl)silanes, the smallest and largest $\mathrm{Si} \cdots \mathrm{O}$-distances are observed for compound 104 (Si $\cdots \mathrm{O} 42.7558(11), \mathrm{Si} \cdots \mathrm{O} 63.1700(11))$. These extremes may be explained by the fact that $\mathbf{1 0 4}$ is the only compound within this series of (2,4,6-trimethoxyphenyl)silanes which bears two Si-2,4,6TMOP moieties, which infers a special steric situation to the coordination sphere at the silicon atom.

Figure 26. Molecular structure of 104 in the crystal (probability level of displacement ellipsoids $50 \%$ ). Selected interatomic distances $(\AA)$ and bond angles (deg): Si-C1 1.8528(14), Si-C10 1.8536(13), Si-Cl1 2.0593(5), Si-Cl2 2.0608(6), Si $\cdots$ O1 2.9623(11), $\mathrm{Si} \cdots \mathrm{O} 3$ 3.0034(12), $\mathrm{Si} \cdots \mathrm{O} 42.7558(11), \mathrm{Si} \cdots \mathrm{O} 63.1700(11), \mathrm{C} 1-\mathrm{Si}-\mathrm{C} 10117.62(6), \mathrm{C} 1-$ $\mathrm{Si}-\mathrm{Cl} 1105.15(5), \mathrm{C} 1-\mathrm{Si}-\mathrm{Cl} 2111.13(5), \mathrm{C} 10-\mathrm{Si}-\mathrm{Cl} 1112.48(5), \mathrm{C} 10-\mathrm{Si}-\mathrm{Cl} 2105.74(5), \mathrm{Cl} 1-\mathrm{Si}-\mathrm{Cl} 2103.98(2)$.

### 11.17 1,1'-Oxybis\{[(1-sila-1-cyclohexyl)methyl]ammonium\} dichloride dihydrate $\left(145 \cdot 2 \mathrm{H}_{2} \mathrm{O}\right)$

Suitable single crystals of $\mathbf{1 4 5} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ were obtained directly from the preparation of this compound (see Experimental Section; crystallization from 6 M hydrochloric acid at $-20{ }^{\circ} \mathrm{C}$; no subsequent drying to avoid loss of the water of crystallization). Compound $\mathbf{1 4 5} \cdot \mathbf{2} \mathrm{H}_{2} \mathrm{O}$ crystallizes in the space group $P 2_{1} / c$. The crystal structure of $\mathbf{1 4 5} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ is governed by hydrogen bonds, leading to

the dication and all OH groups of the two crystallographically independent water molecules act as proton donors, whereas both chloride anions and the oxygen atoms of both water molecules act as proton acceptors.

Figure 27. Structure of the dication in the crystal of $\mathbf{1 4 5} \cdot 2 \mathrm{H}_{2} \mathrm{O}$. Selected bond distances ( $\AA$ ) and angles (deg): Si1-O1 1.6317(9), Si2-O1 1.6360(9), Si1-C1 1.8826(12), Si1-C2 1.8574(14), Si1-C6 1.8677(12), Si2-C7 1.8859(12), Si2-C8 1.8589(13), Si2-C12 1.8584(13), Si1-O1-Si2 152.05(6), O1-Si1-C1 107.67(5), O1-Si1-C2 110.54(6), O1-Si1-C6 111.88(6), O1-Si2-C7 106.47(5), O1-Si2-C8 112.94(6), O1-Si2-C12 111.04(6), C1-Si1-C2 112.33(6), C1-Si1-C6 109.22(6), C2-Si1-C6 105.25(6), C7-Si2-C8 108.66(6), C7-Si2-C12 111.11(6), C8-Si2-C12 106.67(6).

### 11.18 1,1'-(Oxybis-1-silacyclobutane-1,1-diyl)bis(2,4,6-trimethoxybenzene)

 (146)Suitable single crystals of $\mathbf{1 4 6}$ were obtained from the mother liquor of the crystallization of compound 74. After evaporation of the solvent of this solution under ambient conditions (humid air, $20^{\circ} \mathrm{C}$ ), a few crystals formed at the surface of the liquid phase. ${ }^{81}$ Compound $\mathbf{1 4 6}$ crystallizes in the space group Pbcn. The asymmetric unit contains half of the molecule (symmetry transformations used to generate equivalent atoms: $\# 1-\mathrm{x}+2, \mathrm{y},-\mathrm{z}+1 / 2$ ). The arrangement of the $\mathrm{Si}-2,4,6$-TMOP moieties may be ascribed to a $\pi$ stacking effect (Figure 28). Apart from that, similar considerations as discussed for $\mathbf{6 1}, \mathbf{6 2}, \mathbf{7 4}, \mathbf{7 5}, \mathbf{1 0 3}$, and $\mathbf{1 0 4}$ apply to compound $\mathbf{1 4 6}$ concerning the $\mathrm{Si} \cdots \mathrm{O}$ contacts between the silicon atom and the oxygen atoms in the ortho-methoxy groups and the conformation of the silacyclobutane ring skeleton; cf. Sections 11.9 and 11.11 (p. 51 and 53).

Figure 28. Molecular structure of 146 in the crystal (probability level of displacement ellipsoids $50 \%$ ). Selected interatomic distances ( $\AA$ ) and bond angles (deg): Si-C1 1.8767(13), Si-C10 1.8735(15), Si-C12 1.8730(14), Si-O4 1.6321(6), $\mathrm{Si} \cdots \mathrm{C} 11$ 2.3756(16), $\mathrm{Si} \cdots \mathrm{O} 12.8795(10), \mathrm{Si} \cdots \mathrm{O} 3$ 3.1008(11), $\mathrm{C} 1-\mathrm{Si}-\mathrm{C} 10$ 119.43(6), $\mathrm{C} 1-\mathrm{Si}-\mathrm{C} 12$ 114.77(6), $\mathrm{C} 1-\mathrm{Si}-\mathrm{O} 4110.02(6), \mathrm{C} 10-\mathrm{Si}-\mathrm{C} 12$ 79.70(7), $\mathrm{C} 10-\mathrm{Si}-\mathrm{O} 4115.19(6), \mathrm{C} 12-\mathrm{Si}-\mathrm{O} 4114.96(6)$. The O4 oxygen atom lies on a special position $(1.000,0.374,0.250)$, and the molecule shows $C_{2}$ symmetry.

## 12 Summary

This work describes (i) the synthesis of sila-analogs (C/Si-exchange) and silicon-containing derivatives of the drugs venlafaxine and bexarotene, the GnRH antagonist AG-045572, and the allosteric modulator W84, (ii) a partial synthesis of sila-gabapentin, and (iii) the development of the Si-2,4,6-trimethoxyphenyl (Si-2,4,6-TMOP) moiety as a novel protecting group in organosilicon chemistry and its application in the synthesis of chlorotris(chloromethyl)silane and tris(chloromethyl)methoxysilane.

### 12.1 Sila-venlafaxine and derivatives

In context with the synthesis of a sila-analog and silicon-containing derivatives of the serotonin/noradrenaline reuptake inhibitor venlafaxine (12a), racemic and non-racemic silavenlafaxine ( $\mathrm{rac} \mathbf{- 1 2 b},(R) \mathbf{- 1 2 b}$, and (S)-12b), its racemic derivatives rac-13 and rac-15, and its racemic prodrugs rac-16, rac-17, rac-18, and rac-18. HCl were prepared. Compound rac-12b was prepared by three different preparation protocols.

In the course of these syntheses, the intermediates 59-63, 66, 67, rac-68, 78, 79, and rac-80 were prepared.

63

66

67

rac-68

78

79

rac-80

In addition, compound $\mathbf{8 1}$ was obtained in admixture with $\mathbf{8 2}$ in the synthesis of rac-15, and pure 81 was prepared from the known compound $\mathbf{5 5}$ ( $\mathbf{8 2}$ is commercially available).

The sila-venlafaxine enantiomers $(R)$-12b and $(S)$ - 12b were prepared from rac-12b by resolution of the racemate using $(+)$ - or $(-)$-camphor-10-sulfonic acid $((+)-$ or $(-)$-CSA) as the resolving agent via $(R) \mathbf{- 1 2 b} \cdot(+)$-CSA and $(S)-\mathbf{1 2 b} \cdot(-)$-CSA as the isolated intermediates, and the enantiomeric purities of $(R)-\mathbf{1 2 b}$ and $(S) \mathbf{- 1 2 b}$ were determined by ${ }^{1} \mathrm{H}$ NMR spectroscopy in the presence of $(R)-(-)-1-(9-$ anthryl)-2,2,2-trifluoroethanol $((R)-(-)$-TFAE) as a chiral solvating agent (in both cases, only one enantiomer of $\mathbf{1 2 b}$ was detected; probe, $\mathrm{NCH}_{3}$ resonance). The absolute configuration of $(R) \mathbf{- 1 2 b}$ was determined by single-crystal X-ray diffraction using the hydrobromide $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$.

(R)-12b

$(R)-\mathbf{1 2 b} \cdot(+)-\mathrm{CSA}$

(S)-12b•(-)-CSA

( $R$ )-12b $\cdot \mathrm{HBr}$

(S)-12b

In the attempts to synthesize the sila-venlafaxine derivative rac-14, the novel silacyclobutane derivatives $\mathbf{7 2 - 7 6}$ were prepared, and compound 77 was obtained from the reaction of $\mathbf{7 6}$ with $\mathrm{HNMe}_{2} /\left[\mathrm{LiNMe}_{2}\right]$.

The selectivity problems which were encountered in the reactions of $\mathbf{7 0} \mathbf{- 7 2}$ with $\mathbf{5 8}$ (twofold substitution of the alkoxy groups to give compound 73) lead to the development of the Si-2,4,6trimethoxyphenyl (Si-2,4,6-TMOP) moiety as a novel protecting group in organosilicon chemistry, which in turn was used for developing an alternative synthesis of rac-sila-venlafaxine (rac-12b) (see above) and applied to the syntheses of chlorotris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24) (see below).

The hydrochlorides of $\mathbf{r a c} \mathbf{- 1 2 b},(R) \mathbf{- 1 2 b},(S) \mathbf{- 1 2 b}, r a c-13$, and $r a c-15$ were prepared to obtain water-soluble compounds for their pharmacological characterization, and compounds rac-12b $\cdot \mathrm{HCl}$, rac-13. HCl , and rac- $\mathbf{1 5} \cdot \mathrm{HCl}$ were studied for their in vitro serotonin, noradrenaline, and dopamine reuptake inhibition efficacy.

All compounds synthesized were characterized by NMR spectroscopy ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}$ (and partially ${ }^{15} \mathrm{~N}$ )) and elemental analyses, and compounds rac-12b $\cdot \mathrm{HCl},(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}, \mathrm{rac} \mathbf{- 1 3}, r a c-\mathbf{1 5}$, rac- $15 \cdot \mathrm{HCl}, 61,62,74,75$, and the disiloxane 146 (obtained by hydrolysis of 74 and subsequent condensation) were additionally characterized by single-crystal X-ray diffraction. Furthermore, the syntheses of $r a c-\mathbf{1 2 b} \cdot \mathrm{HCl},(R) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$, and $(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ were scaled up to scales of tens of grams.

### 12.2 Disila-bexarotene

Disila-bexarotene (21b), a silicon analog of the retinoid bexarotene (21a), was synthesized via the intermediates 84-89. 1,2-Bis(ethynyldimethylsilyl)ethane (84) has already been reported in the literature (preparation from 83 using ethynylmagnesium bromide), whereas the use of sodium acetylide for the reaction $\mathbf{8 3} \rightarrow \mathbf{8 4}$ was established within this work and represents a more costeffective way for the preparation of $\mathbf{8 4}$ compared to the use of ethynylmagnesium bromide.

87

88

89

The target compound 21b and all the intermediates were characterized by NMR spectroscopy $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}\right.$ ) and elemental analyses, and compounds 21a, 21b, and 89 were additionally characterized by single-crystal X-ray diffraction. The synthesis of 21b was scaled up successfully to a scale of ca. 30 g .

### 12.3 Disila-AG045572

The first attempt to synthesize disila-AG-045572 (22b), a disila-analog of the non-peptide GnRH antagonist AG-045572 (22a), started from compound 91, which was reacted successfully with $\mathbf{8 4}$ in a cobalt-catalyzed $\left(\mathrm{CpCo}(\mathrm{CO})_{2}\right)$ Vollhardt cyclization to give $\mathbf{9 3}$. Surprisingly, $\mathbf{9 3}$ was deprotonated twice upon treatment with one molar equivalent of various common lithiation reagents (e.g., $n$-BuLi/TMEDA) under various reaction conditions (reaction control by silylation with chlorotrimethylsilane followed by GC/EI MS analysis). Monolithiation (which would give 94) was never observed.

El = C: AG-045572 (22a)
El $=$ Si: Disila-AG-045572 (22b)

84

91

93

94

Although this result prevented the synthesis of disila-AG-045572 (22b) by this route, the preparation of $\mathbf{9 3}$ was the first successful synthesis of a molecule with a 3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl moiety starting from 84, and this method was then, in turn, applied by Amedis Pharmaceuticals Ltd., Cambridge, U.K. to a Vollhardt cyclization using 84 and $\mathbf{9 7}$ as the starting materials, which enabled the synthesis of $\mathbf{2 2 b}$ via $\mathbf{9 8}$ and $\mathbf{9 9}$ using a reaction of $\mathbf{9 9}$ with thionyl chloride and then with 101 in the final step.

97

98

99

These methods which had been developed jointly in cooperation with Amedis Pharmaceuticals Ltd., Cambridge, U.K. were then finally optimized in this work regarding yield and purity of the intermediates $\mathbf{9 7 - 9 9}$ and of the target compound $\mathbf{2 2 b}$, and additional methods for the preparation of 22b starting from 99 and using dicyclohexylcarbodiimide (DCC) instead of thionyl chloride or starting from 98 and using a reagent prepared from $101 \cdot \mathrm{HCl}$ and trimethylaluminum were developed as well in this work, thereby leading to a pronounced improvement of the total yield of this synthesis.

The known compound $\mathbf{1 0 1}$ as well as $\mathbf{1 0 1} \cdot \mathrm{HCl}$ were prepared starting from $\mathbf{1 0 0} \cdot \mathrm{MeOH}$ by a Hofmann rearrangement using potassium hypochlorite, which represents a novel and cost-effective method for the preparation of $\mathbf{1 0 1}$.

The target compound 22b and all the intermediates were characterized by NMR spectroscopy $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}\right.$ (only in the case of 22b), ${ }^{29} \mathrm{Si}$ ) and elemental analyses, and compounds $\mathbf{2 2 b}$ and 99 were additionally characterized by single-crystal X-ray diffraction.

## 12.4 (Chloromethyl)silanes

The $\mathrm{Si}-2,4,6$-TMOP group, which had been developed as a novel protecting group in organosilicon chemistry in context with the synthesis of sila-venlafaxine, was applied successfully to the synthesis of chlorotris(chloromethyl)silane (23) and tris(chloromethyl)methoxysilane (24) via the intermediates trichloro(2,4,6-trimethoxyphenyl)silane (102) and tris(chloromethyl)(2,4,6trimethoxyphenyl)silane (103).

In an attempt to synthesize dichlorobis(chloromethyl)silane (25) using the Si-2,4,6-TMOP group, dichlorobis(2,4,6-trimethoxyphenyl)silane (104) was prepared. However, the further transformation of $\mathbf{1 0 4}$ with $\mathrm{BrCH}_{2} \mathrm{Cl} / n$-Buli to the intermediate $\mathbf{1 0 5}$ failed, which prevented the synthesis of $\mathbf{2 5}$ by this route.

The target compounds 23 and 24 and all the intermediates were characterized by NMR spectroscopy ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}$ ) and elemental analyses, and compounds $\mathbf{1 0 3}$ and $\mathbf{1 0 4}$ were additionally characterized by single-crystal X-ray diffraction.

### 12.5 Silicon-based allosteric modulators of muscarinic $\mathbf{M}_{2}$ receptors

In continuation of earlier studies of silicon-based allosteric modulators of muscarinic $\mathrm{M}_{2}$ receptors, compounds 26-28, 31-50, rac-51, rac-52, and 53 (isolated as $\mathbf{5 3} \cdot \mathrm{HCl}$ ) were synthesized. In addition, the hitherto unknown intermediates $\mathbf{1 1 4}, \mathbf{1 1 7} \mathbf{- 1 2 6}$, rac-127, and rac-132 were prepared.

114
n Cpd.

121
122

126

rac-127

All target compounds and the intermediates were characterized by NMR spectroscopy ( ${ }^{1} \mathrm{H}$, ${ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}$ (partially), ${ }^{29} \mathrm{Si}$ ) and elemental analyses. Compounds 27, 28, 32, 33, 35, 36, 39, 42, 45-50, rac-51, rac-52, and $\mathbf{5 3}$ (tested as the hydrochloride $\mathbf{5 3} \cdot \mathrm{HCl}$ ) were studied for their allosteric effects on $\left[{ }^{3} \mathrm{H}\right]$ NMS dissociation and $\left[{ }^{3} \mathrm{H}\right]$ NMS equilibrium binding at muscarinic $\mathrm{M}_{2}$ receptors of porcine heart homogenates (SAR studies). For most of these compounds, positive cooperativity was found in this test system (exceptions: compounds 46 and 48), i.e., an enhancement of $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ equilibrium binding was observed.

## $12.6 \beta$-Carbonylsilanes

In context with the partial synthesis of sila-gabapentin (54b) (a sila-analog of the antiepileptic gabapentin (54a)), a series of $\beta$-carbonylsilanes with a silacyclohexane backbone was synthesized (compounds 137-144), starting from 136, and several methods for functional group transformations within the organic side chains of these molecules in the very presence of the sensitive $\mathrm{Si}-$ $\mathrm{CH}_{2} \mathrm{C}(\mathrm{O}) \mathrm{R}$ bond were established.

Treatment of 140 with triphenylphosphine (Staudinger reaction), followed by acidic hydrolysis, gave the disiloxane $145\left(\mathrm{Si}^{-} \mathrm{CH}_{2} \mathrm{C}(\mathrm{O}) \mathrm{R}\right.$ bond cleavage), the dihydrate $\mathbf{1 4 5} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ of which was characterized by single-crystal X-ray diffraction. Compounds 137-145 were characterized by NMR spectroscopy ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}$ (partially), ${ }^{29} \mathrm{Si}$ ) and elemental analyses.

144

## 13 Zusammenfassung

Die vorliegende Arbeit beschreibt (i) die Synthese siliciumhaltiger Analoga (C/Si-Austausch) und siliciumhaltiger Derivate der Wirkstoffe Venlafaxin und Bexarotene, des GnRH Antagonisten AG-045572 und des allosteren Modulators W84, (ii) eine Partialsynthese von Sila-Gabapentin und (iii) die Entwicklung der Si-2,4,6-Trimethoxyphenyl-Gruppe (Si-2,4,6-TMOP-Gruppe) als neuartige Schutzgruppe in der Organosiliciumchemie und ihre Anwendung in der Synthese von Chlortris(chlormethyl)silan und Tris(chlormethyl)methoxysilan.

### 13.1 Sila-venlafaxin und Derivative

Im Zusammenhang mit der Synthese eines Sila-Analogons und siliciumhaltiger Derivate des Serotonin/Noradrenalin-Wiederaufnahmehemmers Venlafaxin (12a) wurden racemisches und nichtracemisches Sila-venlafaxin ( $\mathrm{rac}-\mathbf{1 2 b},(R) \mathbf{- 1 2 b}$ und $(S)$-12b), dessen racemische Derivate rac-13 und rac-15 und dessen racemische „Prodrugs" rac-16, rac-17, rac-18 und rac-18•HCl dargestellt. Verbindung rac-12b wurde nach drei verschiedenen präparativen Methoden dargestellt.

$\mathrm{El}=\mathrm{C}:$ rac-Venlafaxin (rac-12a)
$\mathrm{El}=\mathrm{Si}:$ rac-Sila-venlafaxin $(r a c-12 b)$

rac-16

rac-13

rac-15

rac-18

Im Verlauf dieser Synthesen wurden die Intermediate 59-63, 66, 67, rac-68, 78, 79 und rac-80 dargestellt.

Ferner wurde $\mathbf{8 1}$ bei der Synthese von rac-15 als Gemisch mit $\mathbf{8 2}$ erhalten und die reine Verbindung $\mathbf{8 1}$ wurde aus der literaturbekannten Verbindung $\mathbf{5 5}$ dargestellt ( $\mathbf{8 2}$ ist als Handelsprodukt verfügbar).

Die Sila-venlafaxin-Enantiomere $(R)$-12b und $(S)$-12b wurden aus rac-12b durch Racematspaltung mit (+)- bzw. ( - -Campher-10-sulfonsäure ( $(+)-\quad$ bzw. ( - -CSA) als Spaltungsreagenz über die isolierten Intermediate $(R) \mathbf{- 1 2 b} \cdot(+)$-CSA und $(S)$-12b $\cdot(-)$-CSA dargestellt. Die Enantiomerenreinheit von $(R) \mathbf{- 1 2 b}$ und $(S)$-12b wurde durch ${ }^{1} \mathrm{H}$-NMR-Spektroskopie in Gegenwart von (R)-(-)-1-(9-Anthryl)-2,2,2-trifluorethanol ((R)-(-)-TFAE) als chiralem Solvatationsreagenz bestimmt (in beiden Fällen wurde nur ein Enantiomer von 12b detektiert; Sonde: $\mathrm{NCH}_{3}$-Resonanz). Die absolute Konfiguration von $(R)$ - $\mathbf{1 2 b}$ wurde durch Einkristall-Röntgenbeugung des Hydrobromids ( $R$ )-12b• $\cdot \mathbf{H B r}$ ermittelt.

$(R)-\mathbf{1 2 b} \cdot \mathrm{HBr}$

(S)-12b

(S)-12b $\cdot(-)-C S A$

Bei den Versuchen, das Sila-venlafaxin-Derivat rac-14 zu synthetisieren, wurden die neuartigen Silacyclobutan-Derivate 72-76 dargestellt, und Verbindung 77 wurde aus der Reaktion von 76 mit $\mathrm{HNMe}_{2} /\left[\mathrm{LiNMe}_{2}\right]$ erhalten.

74

75

76

77

Die Selektivitätsprobleme, die sich bei den Reaktionen von 70-72 mit $\mathbf{5 8}$ stellten (Zweifachsubstitution der Alkoxygruppen, was Verbindung 73 ergab) führten zur Entwicklung der Si -2,4,6-Trimethoxyphenyl-Gruppe (Si-2,4,6-TMOP-Gruppe) als neuartige Schutzgruppe in der Organosiliciumchemie. Diese Schutzgruppe wurde für die Entwicklung einer alternativen Synthese von rac-Sila-venlafaxin (rac-12b) (siehe oben) sowie zur Synthese von Chlortris(chlormethyl)silan (23) und Tris(chlormethyl)methoxysilan (24) (siehe unten) verwendet.

Die Hydrochloride der Verbindungen rac-12b, ( $R$ )-12b, (S)-12b, rac-13, and rac-15 wurden dargestellt, um wasserlösliche Verbindungen für deren pharmakologische Charakterisierung zu erhalten. Die Verbindungen rac- $\mathbf{1 2 b} \cdot \mathrm{HCl}$, rac- $\mathbf{1 3} \cdot \mathrm{HCl}$ und rac- $\mathbf{1 5} \cdot \mathrm{HCl}$ wurden hinsichtlich ihrer in vitro-Aktivität bezüglich der Wiederaufnahmehemmung von Serotonin, Noradrenalin und Dopamin untersucht.

Alle synthetisierten Verbindungen wurden durch NMR-Spektroskopie ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}$ (und teilweise ${ }^{15} \mathrm{~N}$ )) und Elementaranalysen charakterisiert. Zusätzlich wurden die Verbindungen rac$\mathbf{1 2 b} \cdot \mathrm{HCl},(R)-\mathbf{1 2 b} \cdot \mathrm{HBr}$, rac-13, rac-15, rac-15•HCl, 61, 62, 74, 75 und das Disiloxan 146 (erhalten durch Hydrolyse von 74 und nachfolgende Kondensation) durch Röntgenbeugung an Einkristallen charakterisiert. Des weiteren wurden die Synthesen von rac-12b $\cdot \mathrm{HCl},(R) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ und $(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ in den zweistelligen Gramm-Bereich hochskaliert.

### 13.2 Disila-bexarotene

Disila-bexarotene (21b), ein Silicium-Analogon des Retinoids Bexarotene (21a), wurde über die Intermediate 84-89 dargestellt. 1,2-Bis(ethinyldimethylsilyl)ethan (84) wurde bereits in der Literatur beschrieben (Darstellung aus $\mathbf{8 3}$ unter Verwendung von Ethinylmagnesiumbromid), wohingegen die Verwendung von Natriumacetylid für die Reaktion $\mathbf{8 3} \boldsymbol{\mathbf { 8 4 }} \mathrm{im}$ Rahmen dieser Arbeit etabliert wurde und - verglichen mit der Verwendung von Ethinylmagnesiumbromid - einen kostengünstigeren Weg für die Darstellung von 84 repräsentiert.

$\mathrm{El}=\mathrm{Si}$ : Disila-bexarotene (21b)

87

88

89

Die Zielverbindung 21b und die genannten Intermediate wurden durch NMR-Spektroskopie $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}\right)$ und Elementaranalysen charakterisiert. Zusätzlich wurden die Verbindungen 21a, 21b und 89 durch Röntgenbeugung an Einkristallen charakterisiert. Die Synthese von 21b wurde erfolgreich auf ca. 30 g hochskaliert.

### 13.3 Disila-AG-045572

Der erste Versuch zur Synthese von Disila-AG-045572 (22b), ein Disila-Analogon des nichtpeptidischen GnRH-Antagonisten AG-045572 (22a), erfolgte ausgehend von Verbindung 91, welche erfolgreich mit $\mathbf{8 4}$ in einer kobaltkatalysierten $\left(\mathrm{CpCo}(\mathrm{CO})_{2}\right)$ Vollhardt-Cyclisierung zu 93 umgesetzt wurde. Überraschenderweise wurde 93 bei Behandlung mit einem Mol-Äquivalent verschiedener gängiger Lithiierungsreagenzien (z.B. $n$-BuLi/TMEDA) unter variierenden Reaktionsbedingungen zweifach deprotoniert (Reaktionskontrolle mittels Silylierung mit Chlortrimethylsilan und nachfolgende GC/EI-MS Analytik). Monolithiierung (die zu 94 führen würde) wurde nie beobachtet.

$\mathrm{El}=\mathrm{C}:$ AG-045572 (22a)
El = Si: Disila-AG-045572 (22b)

84

91

93

94

Obwohl dieses Ergebnis die Synthese von Disila-AG-045572 (22b) auf diesem Weg verhinderte, war die Darstellung von 93 die erste erfolgreiche Synthese eines Moleküls mit einer 3,5,5,8,8-Pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl-Gruppe ausgehend von 84. Diese Methode wurde nachfolgend von Amedis Pharmaceuticals Ltd., Cambridge, U.K., auf eine VollhardtCyclisierung unter Verwendung von 84 und 97 als Ausgangsmaterialien angewendet, was die Synthese von 22b via 98 und 99 unter Verwendung einer Reaktion von 99 mit Thionylchlorid und nachfolgend mit 101 im letzten Schritt ermöglichte.

97

98

99

Diese Methoden, die zusammen mit Amedis Pharmaceuticals Ltd., Cambridge, U.K., entwickelt worden waren, wurden dann schließlich im Rahmen dieser Arbeit bezüglich der Ausbeute und Reinheit der Zwischenstufen 97-99 und der Zielverbindung 22b optimiert. Ebenso wurden im Rahmen dieser Arbeit weitere Methoden zur Darstellung von 22b entwickelt, ausgehend von 99 unter Verwendung von Dicyclohexylcarbodiimid (DCC) anstelle von Thionylchlorid oder ausgehend von 98 unter Verwendung eines Reagenzes dargestellt aus $101 \cdot \mathrm{HCl}$ und Trimethylaluminium, was zu einer deutlichen Verbesserung der Gesamtausbeute dieser Synthese führte.

Die bekannte Verbindung 101 sowie $\mathbf{1 0 1} \cdot \mathrm{HCl}$ wurden ausgehend von $\mathbf{1 0 0} \cdot \mathrm{MeOH}$ durch Hofmann-Umlagerung unter Verwendung von Kaliumhypochlorit dargestellt, was einen neuen und kostengünstigen Weg für die Darstellung von 101 repräsentiert.

$100 \cdot \mathrm{MeOH}$

101

Die Zielverbindung 22b und die genannten Zwischenstufen wurden durch NMR-Spektroskopie $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}\right.$ (nur im Falle von 22b), ${ }^{29} \mathrm{Si}$ ) und Elementaranalysen charakterisiert. Zusätzlich wurden die Verbindungen 22b und $\mathbf{9 9}$ durch Röntgenbeugung an Einkristallen charakterisiert.

## 13.4 (Chlormethyl)silane

Die Si -2,4,6-TMOP-Gruppe, die im Zusammenhang mit der Sila-venlafaxin-Synthese als neuartige Schutzgruppe für die Organosiliciumchemie entwickelt worden war, wurde erfolgreich auf die Synthese von Chlortris(chlormethyl)silan (23) und Tris(chlormethyl)methoxysilan (24) über die Intermediate Trichlor(2,4,6-trimethoxyphenyl)silan (102) und Tris(chlormethyl)(2,4,6trimethoxyphenyl)silan (103) angewendet.

102

Im Zuge von Bemühungen, Dichlorbis(chlormethyl)silan (25) unter Verwendung der Si-2,4,6-TMOP-Gruppe zu synthetisieren, wurde Dichlorbis(2,4,6-trimethoxyphenyl)silan (104) dargestellt. Jedoch schlug dessen weitere Umsetzung mit $\mathrm{BrCH}_{2} \mathrm{Cl} / n$-BuLi zu 105 fehl, was die Synthese von 25 auf diesem Weg verhinderte.

Die Zielverbindungen 23 und 24 und die genannten Zwischenstufen wurden durch NMRSpektroskopie ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}$ ) und Elementaranalysen charakterisiert. Zusätzlich wurden die Verbindungen $\mathbf{1 0 3}$ und $\mathbf{1 0 4}$ durch Röntgenbeugung an Einkristallen charakterisiert.

### 13.5 Allostere $\mathbf{M}_{2}$-Muscarinrezeptor-Modulatoren auf Siliciumbasis

Im Rahmen der Weiterführung früherer Studien über allostere $\mathrm{M}_{2}$-MuscarinrezeptorModulatoren auf Siliciumbasis wurden die Verbindungen 26-28, 31-50, rac-51, rac-52 und 53 (isoliert als $\mathbf{5 3} \cdot \mathrm{HCl}$ ) synthetisiert. Ferner wurden die bisher nicht literaturbekannten Zwischenstufen 114, 117-126, rac-127 und rac-132 dargestellt.

Alle Zielverbindungen und Zwischenstufen wurden durch NMR-Spektroskopie $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}\right.$ (partiell), ${ }^{29}$ Si) und Elementaranalysen charakterisiert. Die Verbindungen 27, 28, 32, 33, 35, 36, 39, 42, 45-50, rac-51, rac-52 und 53 (als Hydrochlorid $\mathbf{5 3} \cdot \mathrm{HCl}$ getestet) wurden hinsichtlich ihres allosterischen Effekts auf die $\left[{ }^{3} \mathrm{H}\right]$ NMS-Dissoziation und $\left[{ }^{3} \mathrm{H}\right]$ NMS-Gleichgewichtsbindung an muscarinischen $\mathrm{M}_{2}$-Rezeptoren von Herzhomogenaten des Hausschweins untersucht („SAR"Studien). Für die meisten dieser Verbindungen wurde positive Kooperativität in diesem Testsystem gefunden (Ausnahmen: Verbindungen 46 und 48), d.h. eine Steigerung der $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ Gleichgewichtsbindung wurde beobachtet.

## $13.6 \beta$-CarbonyIsilane

Im Zusammenhang mit der Partialsynthese von Sila-gabapentin (54b) (ein Sila-Analogon des Antiepileptikums Gabapentin (54a)) wurde ausgehend von 136 eine Reihe von $\beta$-Carbonylsilanen mit einem Silacyclohexan-Grundgerüst synthetisiert (Verbindungen 137-144). Mehrere Methoden für Umwandlungen funktioneller Gruppen in den organischen Seitenketten dieser Moleküle in Gegenwart der empfindlichen $\mathrm{Si}-\mathrm{CH}_{2} \mathrm{C}(\mathrm{O})$ R-Bindung wurden etabliert.

Behandlung von 140 mit Triphenylphosphin (Staudinger-Reaktion) - gefolgt durch saure Hydrolyse - ergab das Disiloxan 145 (Si-CH2C(O)R-Bindungsbruch), dessen Dihydrat $145 \cdot 2 \mathrm{H}_{2} \mathrm{O}$ durch Röntgenbeugung an Einkristallen charakterisiert wurde. Die Verbindungen 137-145 wurden durch NMR-Spektroskopie ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}$ (partiell), ${ }^{29} \mathrm{Si}$ ) und Elementaranalysen charakterisiert.

## 14 Experimental section

### 14.1 General procedures

Syntheses. All syntheses (except for the hydrolyses yielding rac-12b, rac-13, rac-15, 21b, 99, and 146 and the preparation of most hydrochlorides, ${ }^{82}$ hydrobromides, and camphor-10sulfonates) were carried out under dry nitrogen. The organic solvents used were dried and purified according to standard procedures and stored under dry nitrogen. A Büchi GKR 50 apparatus was used for the bulb-to-bulb distillations. Melting points were determined with a Büchi Melting Point B-540 apparatus using samples in open glass capillaries except for compounds $\mathbf{1 0 2}$ and 104, for which sealed glass capillaries were used.

NMR spectroscopy. The ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}$, and ${ }^{29} \mathrm{Si}$ solution NMR spectra were recorded on a Bruker DRX-300 NMR spectrometer ( ${ }^{1} \mathrm{H}, 300.1 \mathrm{MHz} ;{ }^{13} \mathrm{C}, 75.5 \mathrm{MHz} ;{ }^{15} \mathrm{~N}, 30.4 \mathrm{MHz} ;{ }^{29} \mathrm{Si}$, 59.6 $\mathrm{MHz}) . \mathrm{CDCl}_{3}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{C}_{6} \mathrm{D}_{6},\left[\mathrm{D}_{8}\right] \mathrm{THF}$, or $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ were used as the solvent. Unless otherwise stated, spectra were recorded at $22{ }^{\circ} \mathrm{C}$. Chemical shifts were determined relative to internal $\mathrm{CHCl}_{3}$ $\left({ }^{1} \mathrm{H}, \delta 7.24 ; \mathrm{CDCl}_{3}\right), \mathrm{CDCl}_{3}\left({ }^{13} \mathrm{C}, \delta 77.0 ; \mathrm{CDCl}_{3}\right), \mathrm{CHDCl}_{2}\left({ }^{1} \mathrm{H}, \delta 5.32 ; \mathrm{CD}_{2} \mathrm{Cl}_{2}\right), \mathrm{CD}_{2} \mathrm{Cl}_{2}\left({ }^{13} \mathrm{C}, \delta\right.$ 53.8; $\left.\mathrm{CD}_{2} \mathrm{Cl}_{2}\right), \mathrm{C}_{6} \mathrm{HD}_{5}\left({ }^{1} \mathrm{H}, \delta 7.28 ; \mathrm{C}_{6} \mathrm{D}_{6}\right), \mathrm{C}_{6} \mathrm{D}_{6}\left({ }^{13} \mathrm{C}, \delta 128.0 ; \mathrm{C}_{6} \mathrm{D}_{6}\right),\left[\mathrm{D}_{7}\right] \mathrm{THF}\left({ }^{1} \mathrm{H}, \delta 1.73 ;\right.$ $\left.\left[\mathrm{D}_{8}\right] \mathrm{THF}\right),\left[\mathrm{D}_{8}\right] \mathrm{THF}\left({ }^{13} \mathrm{C}, \delta 25.3 ;\left[\mathrm{D}_{8}\right] \mathrm{THF}\right),\left[\mathrm{D}_{5}\right] \mathrm{DMSO}\left({ }^{1} \mathrm{H}, \delta 2.49 ;\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right),\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\left({ }^{13} \mathrm{C}\right.$, $\left.\delta 39.5 ;\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right)$, external formamide $\left({ }^{15} \mathrm{~N}, \delta-268.0 ; \mathrm{CDCl}_{3}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{C}_{6} \mathrm{D}_{6},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right)$, or external TMS $\left({ }^{29} \mathrm{Si}, \delta 0 ; \mathrm{CDCl}_{3}, \mathrm{CD}_{2} \mathrm{Cl}_{2}, \mathrm{C}_{6} \mathrm{D}_{6},\left[\mathrm{D}_{8}\right] \mathrm{THF},\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right)$. The reported chemical shifts refer to the $\delta$ scale and are given in [ppm]. Analysis and assignment of the ${ }^{1} \mathrm{H}$ NMR data was supported by ${ }^{1} \mathrm{H},{ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{1} \mathrm{H},{ }^{15} \mathrm{~N},{ }^{1} \mathrm{H}$, and ${ }^{29} \mathrm{Si},{ }^{1} \mathrm{H}$ correlation experiments and partially by simulations using the WIN-DAISY software package (version 4.05, Bruker). ${ }^{83}$ Assignment of the ${ }^{13} \mathrm{C}$ NMR data was supported by DEPT 90, DEPT 135, and ${ }^{13} \mathrm{C},{ }^{1} \mathrm{H}$ correlation experiments. The ${ }^{2} J_{\mathrm{HH}}$ coupling constants reported for the $\mathrm{C}=\mathrm{CH}_{2}$ groups represent absolute values. Abbreviations for the signal assignments: $\mathrm{Fu}=$ Furyl; Me-phth $=4$-methylphthalimido; Naph $=3,5,5,8,8$ -pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl; Naph' $=3,5,5,8,8$-pentamethyl-5,6,7,8-tetrahydro-2-naphthyl; Naphth $=1,8$-naphthalimido; Phe $=1$-carboxyphenyl; Phe' $=1-$ $($ methoxycarbonyl $)$ phenyl; Phth = phthalimido; Succ = succinimido; Tri $=$ 2,4,6-trimethoxyphenyl.

Mass spectrometry. The GC/EI MS studies were performed with a ThermoQuest gas chromatograph MS-8060 (phenomenex Zebron ZB-1 capillary column, 15 m , i.d. 0.25 mm , film thickness $0.25 \mu \mathrm{~m}$; injector, split (1:10), $220^{\circ} \mathrm{C}$; carrier gas, helium) and a ThermoQuest mass spectrometer TRIO 1000 (EI MS, 70 eV ).

Polarimetry. Specific optical rotations were determined with a Jasco P-1030 Polarimeter using a 10 cm cuvette; dichloromethane (spectroscopy grade, stabilized with amylene ( $25 \mathrm{mg} / \mathrm{L}$ ); Riedel-deHaën, art. no. 34908) was used as the solvent.

IR spectroscopy. The IR spectra were recorded on a Bruker Equinox 55 FT-IR spectrometer. The sample preparations are specified in the respective preparation protocols.

Determination of enantiomeric purities. Compounds rac-12b, (R)-12b, or (S)-12b (10.0 $\mathrm{mg}, 34.1 \mu \mathrm{~mol}$ ) and ( $R$ )-(-)-TFAE ( $26.4 \mathrm{mg}, 95.6 \mu \mathrm{~mol}$; 2.8 molar equivalents) were dissolved in $\mathrm{CDCl}_{3}(700 \mu \mathrm{~L})$, and the solutions were studied at $22{ }^{\circ} \mathrm{C}$ by ${ }^{1} \mathrm{H}$ NMR spectroscopy ( 300.1 MHz ). The ${ }^{1} \mathrm{H}$ NMR resonance signals for the $\mathrm{NCH}_{3}$ groups were used as the probe to determine the enantiomeric purities of $(R) \mathbf{- 1 2 b}$ and $(S) \mathbf{- 1 2 b}$. When measuring a sample of $r a c-\mathbf{1 2 b}$, base line separation for the $\mathrm{NCH}_{3}$ signals was found for the diastereomeric solvates $(R) \mathbf{- 1 2 b} \cdot(R)-(-)$-TFAE $(\delta$ $2.13 \mathrm{ppm})$ and $(S)-\mathbf{1 2 b} \cdot(R)-(-)-$ TFAE $(\delta 2.10 \mathrm{ppm})$.

### 14.2 Syntheses

Preparation of \{6-[dimethyl(3-phthalimidopropyl)silyl]hexyl\}dimethyl(3-phthalimidopropyl)ammonium bromide (10). ${ }^{60}$ Compound $\mathbf{1 0}$ was prepared from $\mathbf{1 2 2}$ ( $1.25 \mathrm{~g}, 3.05 \mathrm{mmol}$ ) and $129(868 \mathrm{mg}, 3.74 \mathrm{mmol})$ in ethanol $(12 \mathrm{~mL})$ and was purified according to a procedure very similar to the workup Protocol A (see pp. 96-97) (for details, see ref. 13) (precipitation for 1 day at $20^{\circ} \mathrm{C}$, then for 3 days at $-25^{\circ} \mathrm{C}$ ) to give 10 in $56 \%$ yield as an amorphous white solid $(1.10 \mathrm{~g}, 1.71$ mmol); mp 174-175 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta-0.07$ (s, $6 \mathrm{H}, \mathrm{SiCH}_{3}$ ), 0.39-0.52 (m, 4 H , $\mathrm{CCH}_{2} \mathrm{SiCH}_{2} \mathrm{C}$ ), $1.13-1.33\left(\mathrm{~m}, 6 \mathrm{H}, \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}^{+}\right), 1.49-1.65\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right.$ and $\left.\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}^{+}\right), 1.95-2.10\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{N}^{+} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}\right.$ ), $2.97\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{N}^{+} \mathrm{CH}_{3}\right.$ ), 3.16-3.26 $\left(\mathrm{m}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{2} \mathrm{~N}^{+}\right), 3.27-3.38\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{N}^{+} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}\right), 3.52\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=7.3 \mathrm{~Hz}, 2 \mathrm{H}\right.$, $\left.\mathrm{NCH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Si}\right), 3.64\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=6.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{N}^{+}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{~N}\right), 7.79-7.90(\mathrm{~m}, 8 \mathrm{H}, H-3 / H-6, H-4 / H-$ 5, Phth). ${ }^{13} \mathrm{C}$ NMR ( $\left.\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta-3.5\left(\mathrm{SiCH}_{3}\right), 11.7\left(\mathrm{~N}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 14.4\left(\mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{~N}^{+}\right)$, $21.58\left(\mathrm{Si}^{( } \mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}^{+}$or $\left.\mathrm{N}^{+} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}\right), 21.59\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}^{+}\right.$or $\left.\mathrm{N}^{+} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}\right)$, $22.5 \quad\left(\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), \quad 23.1 \quad\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{~N}^{+}\right), \quad 25.4 \quad\left(\mathrm{Si}^{( }\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}^{+}\right), \quad 32.4$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{~N}^{+}\right), 34.6 \quad\left(\mathrm{~N}^{+}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{~N}\right), 40.4 \quad\left(\mathrm{NCH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Si}\right), 49.9 \quad\left(\mathrm{~N}^{+} \mathrm{CH}_{3}\right), 60.6$ $\left(\mathrm{N}^{+} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}\right), 63.1\left(\mathrm{Si}_{( }\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{2} \mathrm{~N}^{+}\right), 122.98$ (C-3/C-6, Phth), 123.04 (C-3/C-6, Phth), 131.5 ( $C-1 / C-2$, Phth), 131.7 ( $C-1 / C-2$, Phth), 134.39 ( $C-4 / C-5$, Phth), 134.41 ( $C-4 / C-5$, Phth), 167.9 $(C=\mathrm{O}$, Phth $), 168.0(C=\mathrm{O}, \mathrm{Phth}) .{ }^{15} \mathrm{~N}$ NMR ( $\left.\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta-328\left(N^{+}\right),-221\left(\mathrm{~N}^{+}\left(\mathrm{CH}_{2}\right)_{3} N\right),-218$ $\left(N\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Si}\right) .{ }^{29} \mathrm{Si}$ NMR ([D $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta 2.9$. Anal. Calcd for $\mathrm{C}_{32} \mathrm{H}_{44} \mathrm{BrN}_{3} \mathrm{O}_{4} \mathrm{Si}: \mathrm{C}, 59.80 ; \mathrm{H}, 6.90 ; \mathrm{N}$, 6.54. Found: C, 59.5; H, 6.9; N, 6.5 .

## Preparation of rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclohexan-1ol (rac-sila-venlafaxine, rac-12b).

Protocol A. A 2.7 M solution of $n$-butyllithium in $n$-heptane ( $35 \mathrm{~mL}, 94.5 \mathrm{mmol}$ of $n$-BuLi) was added dropwise at $-50^{\circ} \mathrm{C}$ within 10 min to a stirred solution of dimethylamine ( $21.6 \mathrm{~g}, 479$ $\mathrm{mmol})$ in THF ( 100 mL ). The resulting mixture was warmed to $-10^{\circ} \mathrm{C}$ within 2 h and then cooled to $-40^{\circ} \mathrm{C}$, followed by dropwise addition of $60(20.0 \mathrm{~g}, 86.1 \mathrm{mmol})$ within a period of 15 min (evolution of hydrogen; rise in temperature from -40 to $-35{ }^{\circ} \mathrm{C}$ ). The resulting stirred yellow solution was warmed to $-20{ }^{\circ} \mathrm{C}$ within 2 h and then kept undisturbed at $-26^{\circ} \mathrm{C}$ for 16 h . Subsequently, the solvent was removed under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$ until a residual volume of 50 mL was obtained. This solution was diluted with diethyl ether ( 200 mL ) and then added in one single portion at $0^{\circ} \mathrm{C}$ to a stirred two-phase mixture of diethyl ether ( 50 mL ) and 2 M potassium acetate/acetic acid buffer $(\mathrm{pH} 4.5)(300 \mathrm{~mL})$. The pH of the aqueous phase changed to pH 7.2 within 10 min and was readjusted to pH 5.0 by addition of small portions of glacial acetic acid. The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 1 h , with the pH of the aqueous phase remaining constantly at pH 5.0 during this time. The aqueous layer was separated, the organic phase was extracted with 1 M potassium acetate/acetic acid buffer ( pH 5.0 ) $(3 \times 100 \mathrm{~mL})$, and the aqueous solutions were combined. Diethyl ether $(150 \mathrm{~mL})$ was added, and the pH of the aqueous phase was adjusted to pH 10.5 by addition of small portions of a saturated aqueous potassium carbonate solution. The organic layer was separated, the aqueous phase was extracted with diethyl ether ( $5 \times$ 100 mL ), and the organic extracts were combined, followed by addition of $n$-hexane ( 200 mL ). The solvent was removed under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$ until a residual volume of 100 mL was obtained, whereupon residual water separated from the organic phase (formation of a two-phase system). The organic layer was separated, the aqueous phase was extracted with $n$ hexane ( $2 \times 100 \mathrm{~mL}$ ), and the organic solutions were combined. The solvent was removed completely under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$ to give a colorless oil. Crystallization of this oil from $n$-pentane ( 400 mL ) at $-26^{\circ} \mathrm{C}$ using seed crystals (obtained by cooling of a solution of oily rac-12b $(3.20 \mathrm{~g})$ in $n$-pentane $(5 \mathrm{~mL})$ to $\left.-26^{\circ} \mathrm{C}\right)$ afforded $\mathrm{rac}-\mathbf{1 2 b}$ in $90 \%$ yield as a colorless crystalline solid ( $22.8 \mathrm{~g}, 77.7 \mathrm{mmol}$ ) (isolated by quick decantation of the cold solvent, followed by drying in vacuo ( $\left.0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}\right)$ ); mp $33^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.44-0.78$, $1.00-1.15$, and $1.19-1.69\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 2.29\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{NCH}_{3}\right), 2.44\left(\delta_{\mathrm{C}}\right), 2.52\left(\delta_{\mathrm{A}}\right)$, and 3.12 $\left(\delta_{\mathrm{B}}\right),\left(3 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-12.1 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=5.0 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=12.1 \mathrm{~Hz}, \operatorname{SiC} H_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}\right), 3.75\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH} H_{3}\right)$, 5.6 (br s, $1 \mathrm{H}, \mathrm{SiOH}), 6.75-6.83$ (m, $2 \mathrm{H}, H-3 / H-5$, Aryl), 6.91-6.98 (m, $2 \mathrm{H}, H-2 / H-6$, Aryl). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 12.1\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 14.2\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 24.06\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 24.13\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.4$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 32.6\left(\mathrm{SiCHC}_{2}\right), 45.4\left(\mathrm{NCH}_{3}\right), 55.2\left(\mathrm{OCH}_{3}\right), 61.8\left(\mathrm{NCH}_{2} \mathrm{C}\right), 113.8(C-3 / C-5$, Aryl),
128.2 (C-2/C-6, Aryl), 133.0 (C-1, Aryl), 157.1 ( $C-4$, Aryl). ${ }^{15} \mathrm{~N}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-353 .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 10.3$. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{NO}_{2} \mathrm{Si}: \mathrm{C}, 65.48 ; \mathrm{H}, 9.27$; $\mathrm{N}, 4.77$. Found: C, $65.5 ; \mathrm{H}, 9.3$; N, 4.8.

Protocol B. A 2.5 M solution of $n$-butyllithium in $n$-hexane ( $4.2 \mathrm{~mL}, 10.5 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise at $-50^{\circ} \mathrm{C}$ within 2 min to a stirred solution of dimethylamine $(6.91 \mathrm{~g}, 153$ mmol ) in THF ( 20 mL ). The resulting mixture was warmed to $-25^{\circ} \mathrm{C}$ within 90 min and then cooled to $-40^{\circ} \mathrm{C}$, followed by dropwise addition of a solution of $\mathbf{6 3}(1.35 \mathrm{~g}, 5.06 \mathrm{mmol})$ in THF ( 8 mL ) within a period of 4 min . The stirred mixture was warmed to $-20^{\circ} \mathrm{C}$ within 2 h and then stirred at $0{ }^{\circ} \mathrm{C}$ for a further 1 h (complete conversion $\mathbf{6 3} \rightarrow \mathrm{rac}-\mathbf{1 6}$; GC control). Subsequently, the mixture was warmed to $20^{\circ} \mathrm{C}$ within 1 h , and the solvent was removed under reduced pressure at $5-15^{\circ} \mathrm{C}$ until a residual volume of ca. 10 mL was obtained. This solution was diluted with diethyl ether (20 mL ) and then added in one single portion at $0^{\circ} \mathrm{C}$ to a stirred two-phase mixture of diethyl ether ( 10 mL ) and 2 M potassium acetate/acetic acid buffer ( $\mathrm{pH} 4.5,50 \mathrm{~mL}$ ). The pH of the aqueous phase changed to pH 5.7 within ca. 10 min and was readjusted to pH 5.0 by addition of small portions of glacial acetic acid. The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 1 h , with the pH of the aqueous phase remaining constantly at pH 5.0 during this time. The aqueous layer was separated, the organic phase was extracted with 1 M potassium acetate/acetic acid buffer ( $\mathrm{pH} 5.0,3 \times 20 \mathrm{~mL}$ ), and the aqueous solutions were combined. Diethyl ether ( 20 mL ) was added to the combined aqueous extracts, and the pH of the aqueous phase was adjusted to pH 10.5 by addition of small portions of a saturated aqueous potassium carbonate solution. The organic layer was separated, the aqueous phase was extracted with diethyl ether ( $4 \times 20 \mathrm{~mL}$ ), and the organic extracts were combined, followed by addition of $n$-hexane ( 80 mL ). The solvent was removed under reduced pressure at 5$15^{\circ} \mathrm{C}$ until a residual volume of ca. 50 mL was obtained, whereupon residual water separated from the organic phase (formation of a two-phase system). The organic layer was separated, the aqueous phase was extracted with $n$-hexane ( $2 \times 15 \mathrm{~mL}$ ), and the organic solutions were combined. The solvent was removed completely under reduced pressure at $5-15{ }^{\circ} \mathrm{C}$ to give a colorless oil, which was dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) and then crystallized from $n$-pentane ( 25 mL ; crystallization at $-26^{\circ} \mathrm{C}$ over a period of 3 days) using seed crystals (see Protocol A). The product was isolated by quick decantation of the cold solvent, followed by drying in vacuo ( $0.001 \mathrm{mbar}, 20$ $\left.{ }^{\circ} \mathrm{C}, 6 \mathrm{~h}\right)$ to give $\mathrm{rac}-\mathbf{1 2 b}$ in $86 \%$ yield as a colorless crystalline solid ( $1.27 \mathrm{~g}, 4.33 \mathrm{mmol}$ ); mp $33^{\circ} \mathrm{C}$. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{NO}_{2} \mathrm{Si}$ : C, 65.48; H, 9.27; N, 4.77. Found: C, 65.6; H, 9.5; N, 4.7. For NMR data, see Protocol A.

Protocol C. Solution A: A 2.0 M ethereal hydrogen chloride solution ( $12.5 \mathrm{~mL}, 25.0 \mathrm{mmol}$ of $\mathrm{HCl})$ was added to a solution of $\mathbf{6 2}(9.39 \mathrm{~g}, 23.6 \mathrm{mmol})$ in diethyl ether $(25 \mathrm{~mL})$ in one single
portion at $0^{\circ} \mathrm{C}$, and the resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 10 min (complete conversion $\mathbf{6 2} \rightarrow$ 63; GC control). The solvent and the excess hydrogen chloride were removed under reduced pressure at $5-15^{\circ} \mathrm{C}$, and the oily residue was dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 10 \mathrm{~min}$ ) and then dissolved in THF ( 25 mL ). Solution B: A 2.5 M solution of $n$-butyllithium in $n$-hexane ( 20.0 mL , 50.0 mmol of $n-\mathrm{BuLi}$ ) was added dropwise at $-50{ }^{\circ} \mathrm{C}$ within 10 min to a stirred solution of dimethylamine ( $13.7 \mathrm{~g}, 304 \mathrm{mmol}$ ) in THF $(50 \mathrm{~mL})$. The resulting mixture was warmed to $-10{ }^{\circ} \mathrm{C}$ within 2 h .

Solution $B$ was then cooled to $-40^{\circ} \mathrm{C}$, followed by dropwise addition of Solution $A$ within a period of 4 min . The resulting stirred mixture was warmed to $-20^{\circ} \mathrm{C}$ within 2 h and then stirred at 0 ${ }^{\circ} \mathrm{C}$ for a further 2 h (complete conversion $\mathbf{6 3} \rightarrow \mathrm{rac}$-16; GC control). Subsequently, the solution was warmed to $20^{\circ} \mathrm{C}$ within 1 h , and the solvent was removed under reduced pressure at $5-15^{\circ} \mathrm{C}$ until a residual volume of ca. 35 mL was obtained. This solution was diluted with diethyl ether ( 50 mL ) and then added in one single portion at $0^{\circ} \mathrm{C}$ to a stirred two-phase mixture of diethyl ether ( 50 mL ) and 2 M potassium acetate/acetic acid buffer ( $\mathrm{pH} 4.5,100 \mathrm{~mL}$ ). The pH of the aqueous phase changed to pH 6.0 within ca. 10 min and was readjusted to pH 5.0 by addition of small portions of glacial acetic acid. The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 1 h , with the pH of the aqueous phase remaining constantly at pH 5.0 during this time. The aqueous layer was separated, the organic phase was extracted with 1 M potassium acetate/acetic acid buffer ( $\mathrm{pH} 5.0,3 \times 50 \mathrm{~mL}$ ), and the aqueous solutions were combined and then extracted with diethyl ether ( 100 mL ). The aqueous layer was separated, the organic phase was extracted with 1 M potassium acetate/acetic acid buffer ( $\mathrm{pH} 5.0,2 \times 50 \mathrm{~mL}$ ) , and the aqueous solutions were combined. Diethyl ether $(100 \mathrm{~mL})$ was added to the combined aqueous extracts, and the pH of the aqueous phase was adjusted to pH 10.5 by addition of small portions of a saturated aqueous potassium carbonate solution. The organic layer was separated, the aqueous phase was extracted with diethyl ether ( $5 \times 150 \mathrm{~mL}$ ), and the organic extracts were combined, followed by addition of $n$-hexane ( 200 mL ). The solvent was removed under reduced pressure at $5-15^{\circ} \mathrm{C}$ until a residual volume of ca. 150 mL was obtained, whereupon residual water separated from the organic phase (formation of a two-phase system). The organic layer was separated, the aqueous phase was extracted with $n$-hexane $(2 \times 50 \mathrm{~mL})$, and the organic solutions were combined. The solvent was removed completely under reduced pressure at $5-15^{\circ} \mathrm{C}$ to give a colorless oil, which was dried in vacuo ( 0.001 mbar, $20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) and then crystallized from $n$-pentane ( 110 mL ; crystallization at $-26^{\circ} \mathrm{C}$ over a period of 3 days) using seed crystals (see Protocol A). The product was isolated by quick decantation of the cold solvent, followed by drying in vacuo $\left(0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}\right)$ to give rac-12b in $86 \%$ yield as a colorless crystalline solid (5.98

## $\mathrm{g}, 20.4 \mathrm{mmol}$ ); mp $33{ }^{\circ} \mathrm{C}$. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{NO}_{2} \mathrm{Si}: \mathrm{C}, 65.48 ; \mathrm{H}, 9.27$; N, 4.77. Found: C, 65.4; H, 9.1; N, 4.7. For NMR data, see Protocol A.

Preparation of (R)-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclohexan-1ol ( $(R)$-sila-venlafaxine, ( $R$ )-12b).
(a) Preparation of seed crystals of (R)-sila-venlafaxine $\cdot(+)$-10-camphorsulfonic acid ((R)12b $\cdot(+)-\mathbf{C S A})$. A solution of (+)-10-camphorsulfonic acid ((+)-CSA) (792 mg, 3.41 mmol ) in acetone $(25 \mathrm{~mL})$ was added at $0^{\circ} \mathrm{C}$ to a solution of $\mathrm{rac}-\mathbf{1 2 b}(1.00 \mathrm{~g}, 3.41 \mathrm{mmol})$ in acetone ( 25 mL ). After the mixture was shaken briefly, it was kept undisturbed at $0^{\circ} \mathrm{C}$. After ca. 10 min , thin needle-shaped crystals precipitated. A further 40 mL of acetone were added immediately, and the mixture was then kept undisturbed at $4{ }^{\circ} \mathrm{C}$ for 2 days. The precipitate was isolated by filtration, washed with acetone ( 20 mL ), and then recrystallized twice from boiling acetone ( 45 mL ; crystallization at $4{ }^{\circ} \mathrm{C}$ over a period of 2 days). (To leave a few seed crystals, the solid was not allowed to dissolve completely in both recrystallization steps.) The product was finally isolated by filtration, washed with acetone ( 3 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give 629 mg of a colorless crystalline solid. This material (long, very thin needles) was used as seed crystals in the following protocol.
(b) Preparation of ( $\boldsymbol{R}$ )-sila-venlafaxine $\cdot(+)$ - $\mathbf{1 0}$-camphorsulfonic acid ( $(\boldsymbol{R})$ - $\mathbf{1 2 b} \cdot(+)-\mathrm{CSA})$. A solution of $(+)$-CSA $(4.55 \mathrm{~g}, 19.6 \mathrm{mmol})$ in acetone $(120 \mathrm{~mL})$ was added at $20^{\circ} \mathrm{C}$ to a solution of rac-12b $(5.75 \mathrm{~g}, 19.6 \mathrm{mmol})$ in acetone $(375 \mathrm{~mL})$. After the mixture was shaken briefly, it was kept undisturbed at $4{ }^{\circ} \mathrm{C}$ for 2 h . Subsequently, a few seed crystals (see above) were added, and the mixture was then kept undisturbed at $4^{\circ} \mathrm{C}$ for 2 days. The resulting precipitate was isolated by filtration, washed with acetone $(2 \times 20 \mathrm{~mL})$, and then recrystallized twice from boiling acetone ( 280 mL ; crystallization at $4^{\circ} \mathrm{C}$ over a period of 2 days). (To leave a few seed crystals, the solid was not allowed to dissolve completely in these recrystallization steps.) The product was isolated and washed as described above and finally dried in vacuo ( $0.001 \mathrm{mbar}, 2{ }^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give $(R) \mathbf{- 1 2 b} \cdot(+)$ CSA in $30 \%$ yield (related to $\mathrm{rac}-\mathbf{1 b}$ ) as a colorless crystalline solid ( $3.10 \mathrm{~g}, 5.90 \mathrm{mmol}$ ); mp 164 ${ }^{\circ} \mathrm{C} ;[\alpha]_{589}^{20}=+7.7\left(c=2.50, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.40-0.75,0.49-0.69,0.99-1.17,1.29-$ 1.45, and 1.47-1.72 (m, $12 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}$ and $\mathrm{CCH}_{\mathrm{O}} \mathrm{H}_{\mathrm{P}} \mathrm{CH}_{\mathrm{Q}} \mathrm{H}_{\mathrm{R}} \mathrm{CCH}_{\mathrm{S}} \mathrm{H}_{\mathrm{T}} \mathrm{SO}_{3}^{-}$, CSA ), $0.83(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{CCH}_{3}, \mathrm{CSA}\right), 1.06\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CCH}_{3}, \mathrm{CSA}\right), 1.86\left(\mathrm{~d}, 1 \mathrm{H},{ }^{2} J_{\mathrm{XY}}=-18.2 \mathrm{~Hz},\left(\mathrm{CHCH}_{\mathrm{X}} \mathrm{H}_{\mathrm{Y}} \mathrm{C}=\mathrm{O}, \mathrm{CSA}\right)\right.$, 1.93-2.03 (m, 1 H, CCH $\mathrm{CH}_{\mathrm{P}} \mathrm{CH}_{\mathrm{Q}} \mathrm{H}_{\mathrm{R}} \mathrm{CCH}_{\mathrm{S}} \mathrm{H}_{\mathrm{T}} \mathrm{SO}_{3}{ }^{-}$, CSA ), 2.03-2.08 (m, $\left.1 \mathrm{H}, \mathrm{C}_{3} \mathrm{CH}, \mathrm{CSA}\right), 2.25-$ $2.36\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CHCH}_{\mathrm{X}} H_{\mathrm{Y}} \mathrm{C}=\mathrm{O}, \mathrm{CSA}\right), 2.49-2.62\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CCH}_{0} \mathrm{H}_{\mathrm{P}} \mathrm{CH}_{\mathrm{Q}} H_{\mathrm{R}} \mathrm{CCH}_{\mathrm{S}} \mathrm{H}_{\mathrm{T}} \mathrm{SO}_{3}{ }^{-}, \mathrm{CSA}\right), 2.7$ (br s, $6 \mathrm{H}, \mathrm{HNCH}_{3}$ ), $2.74\left(\delta_{\mathrm{S}}\right)$ and $3.20\left(\delta_{\mathrm{T}}\right)\left({ }^{2} J_{\mathrm{ST}}=-14.6 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{CCH}_{\mathrm{S}} H_{\mathrm{T}} \mathrm{SO}_{3}{ }^{-}, \mathrm{CSA}\right), 2.84\left(\delta_{\mathrm{C}}\right)$, $3.47\left(\delta_{\mathrm{A}}\right)$, and $3.84\left(\delta_{\mathrm{B}}\right)\left({ }^{2} J_{\mathrm{AB}}=-13.3 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=10.6 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=2.5 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{SiCH}_{\mathrm{C}} \mathrm{C} H_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}\right)$, 3.77 (s, $3 \mathrm{H}, \mathrm{OCH}_{3}$ ), 5.1 (br s, $1 \mathrm{H}, \mathrm{SiOH}$ ), 6.82-6.89 (m, $2 \mathrm{H}, \mathrm{H}-3 / H-5$, Aryl), 7.08-7.15 (m, 2 H ,

Anal. Calcd for $\mathrm{C}_{26} \mathrm{H}_{43} \mathrm{NO}_{6} \mathrm{SSi}$ : C, 59.39 ; H, 8.24; N, 2.66; S, 6.10. Found: C, 59.4; H, 8.2; N, 2.7; S, 6.0.
(c) Preparation of $(\boldsymbol{R})$-sila-venlafaxine ( $(\boldsymbol{R}) \mathbf{- 1 2 b})$. Diethyl ether $(5 \mathrm{~mL})$ was added at $20^{\circ} \mathrm{C}$ to a stirred solution of $(R) \mathbf{- 1 2 b} \cdot(+)$-CSA $(3.05 \mathrm{~g}, 5.80 \mathrm{mmol})$ in water $(85 \mathrm{~mL})$, and the pH of the aqueous phase was adjusted to pH 10.5 by addition of a saturated aqueous potassium carbonate solution. The resulting mixture was extracted with diethyl ether $(4 \times 100 \mathrm{~mL})$, and the organic layers were combined, followed by addition of $n$-hexane $(200 \mathrm{~mL})$. The solvent was removed under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$ until a residual volume of 50 mL was obtained. The mixture was then kept at $-20^{\circ} \mathrm{C}$ for 3 h (crystallization of the residual water), and the organic supernatant was quickly isolated by decantation and stored separately. The ice was allowed to melt, the resulting aqueous phase was shaken with $n$-hexane ( 60 mL ), and the two-phase system was again kept at $-20^{\circ} \mathrm{C}$ for 3 h . The decantation procedure was repeated, the organic solutions were combined, and the solvent was removed under reduced pressure in a water bath $\left(5-15{ }^{\circ} \mathrm{C}\right)$. The resulting colorless oil was dissolved in $n$-pentane ( 35 mL ), and the solution was kept undisturbed at $-20^{\circ} \mathrm{C}$. After a period of ca. 2-3 h, an oil separated, and a few crystals grew within the oil drops. The mixture was then warmed to $20^{\circ} \mathrm{C}$, whereupon the oil dissolved rapidly, whereas the crystals dissolved only slowly. After most of the crystals were dissolved (except for a few seed crystals), the mixture was again kept undisturbed at $-20^{\circ} \mathrm{C}$ for 3 days. The resulting product was isolated by decantation and then dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give $(R) \mathbf{- 1 2 b}$ in $99 \%$ yield as a colorless crystalline solid $(1.68 \mathrm{~g}, 5.72 \mathrm{mmol}$; including workup of the mother liquor by concentrating it to a volume of 10 mL and using the crystallization protocol described above); mp $64-65{ }^{\circ} \mathrm{C} ;[\alpha]_{589}^{20}=-40.3\left(c=2.50, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. The NMR data of the product were identical with those obtained for rac-12b. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{NO}_{2} \mathrm{Si}$ : C, 65.48; H, 9.27; N, 4.77. Found: C, 65.2; H, 9.1; N, 4.7.

## Preparation of (S)-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclohexan-1ol ( $(S)$-sila-venlafaxine, ( $S$ )-12b).

(a) Preparation of ( $S$ )-sila-venlafaxine $\cdot(-)$-10-camphorsulfonic acid ( $(S)$-12b $\cdot(-)$-CSA). The combined mother liquors obtained in the preparation of $(R) \mathbf{- 1 2 b} \cdot(+)$-CSA (see above) were used to prepare (S)-12b•(-)-CSA. For this purpose, the mother liquors were concentrated under
reduced pressure, treated with potassium carbonate as described for the preparation of $(R) \mathbf{- 1 2 b}$, and concentrated again, and the oily residue was then reacted with (-)-CSA analogous to the protocol described for the preparation of $(R)-\mathbf{1 2 b} \cdot(+)$-CSA. Compound $(S) \mathbf{- 1 2 b} \cdot(-)$-CSA was obtained in $32 \%$ yield (related to $\mathrm{rac} \mathbf{- 1 2 b}$ ) as a colorless crystalline solid ( $3.29 \mathrm{~g}, 6.26 \mathrm{mmol}$ ); mp $164{ }^{\circ} \mathrm{C}$; $[\alpha]_{589}^{20}=-7.6\left(c=2.50, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. The NMR data of the product were identical with those obtained for (R)-12b•(+)-CSA. Anal. Calcd for $\mathrm{C}_{26} \mathrm{H}_{43} \mathrm{NO}_{6} \mathrm{SSi}$ : C, 59.39 ; H, 8.24; N, 2.66; S, 6.10. Found: C, 59.3; H, 7.9; N, 2.4; S, 5.9.
(b) Preparation of $(\boldsymbol{S})$-sila-venlafaxine ( $(\boldsymbol{S})$-12b). Compound ( $S$ )-12b was prepared from $(S)-\mathbf{1 2 b} \cdot(-)$-CSA $(3.23 \mathrm{~g}, 6.14 \mathrm{mmol})$ analogous to the synthesis of $(R) \mathbf{- 1 2 b}$ and was isolated in $94 \%$ yield as a colorless crystalline solid $(1.70 \mathrm{~g}, 5.79 \mathrm{mmol})$; mp $64-65^{\circ} \mathrm{C} ;[\alpha]_{589}^{20}=+40.3(c=$ 2.50, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). The NMR data of the product were identical with those obtained for rac-12b. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{NO}_{2} \mathrm{Si}$ : C, 65.48; H, 9.27; N, 4.77. Found: C, 65.2; H, 9.1; N, 4.8.

Preparation of rac-[2-(1-hydroxy-1-sila-1-cyclohexyl)-2-(4-methoxyphenyl)ethyl]dimethylammonium chloride (rac-sila-venlafaxine hydrochloride, rac-12b•HCl). A 2 M ethereal hydrogen chloride solution ( $23 \mathrm{~mL}, 46.0 \mathrm{mmol}$ of HCl ) was added in one single portion at $20{ }^{\circ} \mathrm{C}$ to a stirred solution of $\mathrm{rac}-\mathbf{1 2 b}(12.9 \mathrm{~g}, 44.0 \mathrm{mmol})$ in dichloromethane ( 200 mL ). The resulting solution was cooled to $-11{ }^{\circ} \mathrm{C}$, and a few seed crystals (obtained from $20 \mu \mathrm{~L}$ of the reaction mixture by slow evaporation of the solvent at $20^{\circ} \mathrm{C}$ ) were added. The mixture was kept undisturbed at $-11^{\circ} \mathrm{C}$ for 1 day and then at $-27^{\circ} \mathrm{C}$ for a further 1 day. The resulting precipitate was isolated by filtration at $-27^{\circ} \mathrm{C}$, washed with ice-cold acetone ( 20 mL ), and dried in vacuo ( 0.001 mbar, $20^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give rac- $\mathbf{1 2 b} \cdot \mathrm{HCl}$ in $90 \%$ yield (including workup of the mother liquor) as a colorless crystalline solid ( $13.0 \mathrm{~g}, 39.4 \mathrm{mmol}$ ); mp $160{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $.^{84} \delta 0.25-0.41$, $0.50-0.69$, and $1.13-1.70\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 2.56\left(\delta_{\mathrm{M}}\right), 2.61\left(\delta_{\mathrm{N}}\right), 2.74\left(\delta_{\mathrm{C}}\right), 3.38\left(\delta_{\mathrm{A}}\right), 3.73\left(\delta_{\mathrm{B}}\right)$, and $9.6\left(\mathrm{br}, \delta_{\mathrm{G}}\right)\left(10 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-13.8 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=2.5 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=12.7 \mathrm{~Hz},{ }^{3} J_{\mathrm{GM}}=3.2 \mathrm{~Hz},{ }^{3} J_{\mathrm{GN}}=3.5\right.$ $\left.\mathrm{Hz}, \mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N} H_{\mathrm{G}}\left(\mathrm{C}\left(H_{\mathrm{M}}\right)_{3}\right)\left(\mathrm{C}\left(H_{\mathrm{N}}\right)_{3}\right)\right), 3.71\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 6.01(\mathrm{~s}, 1 \mathrm{H}, \mathrm{SiOH}), 6.83-6.91(\mathrm{~m}$, $2 \mathrm{H}, H-3 / H-5$, Aryl), $7.14-7.22$ (m, $2 \mathrm{H}, H-2 / H-6$, Aryl). ${ }^{13} \mathrm{C}$ NMR ( $\left.\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta 12.4\left(\mathrm{SiCH}_{2} \mathrm{C}\right)$, $13.2\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 23.6\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 23.7\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.2\left(\mathrm{Si}_{\left.\left(\mathrm{CH}_{2}\right)_{2} C \mathrm{CH}_{2} \mathrm{C}\right), 30.8\left(\mathrm{SiCHC}_{2}\right), 41.4}\right.$ $\left(\mathrm{NCH}_{3}\right), 43.0\left(\mathrm{NCH}_{3}\right), 54.9\left(\mathrm{OCH}_{3}\right), 57.6\left(\mathrm{CCH}_{2} \mathrm{~N}\right), 114.0(C-3 / C-5$, Aryl), $128.7(C-2 / C-6$, Aryl), 130.5 (C-1, Aryl), 157.2 (C-4, Aryl). ${ }^{15} \mathrm{~N}$ NMR ([D $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta-338 .{ }^{29} \mathrm{Si}$ NMR ([D $\left.\left.{ }_{6}\right] \mathrm{DMSO}\right): \delta$ 2.8. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{ClNO}_{2} \mathrm{Si}: \mathrm{C}, 58.25 ; \mathrm{H}, 8.55 ; \mathrm{N}, 4.25$. Found: C, $58.1 ; \mathrm{H}, 8.4 ; \mathrm{N}, 4.3$.

Preparation of (R)-[2-(1-hydroxy-1-sila-1-cyclohexyl)-2-(4-methoxyphenyl)ethyl]dimethylammonium chloride ( $(\boldsymbol{R})$-sila-venlafaxine hydrochloride, $(\boldsymbol{R}) \mathbf{- 1 2 b} \cdot \mathbf{H C l})$.

Protocol A. A 2 M ethereal hydrogen chloride solution ( $1.8 \mathrm{~mL}, 3.6 \mathrm{mmol}$ of HCl ) was added at $20^{\circ} \mathrm{C}$ to a solution of $(R) \mathbf{- 1 2 b}(1.00 \mathrm{~g}, 3.41 \mathrm{mmol})$ in dichloromethane $(19 \mathrm{~mL})$, and the resulting mixture was shaken briefly. Upon vapor diffusion of diethyl ether into this mixture at $20^{\circ} \mathrm{C}$ over a period of 6 days, a crystalline product was obtained, which was isolated by filtration, washed with diethyl ether ( 40 mL ), and finally dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give $(R) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ in $93 \%$ yield as a colorless crystalline solid $(1.04 \mathrm{~g}, 3.15 \mathrm{mmol}) ; \mathrm{mp} 174{ }^{\circ} \mathrm{C} ;[\alpha]_{589}^{20}=-29.3(c=1.00$, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). ${ }^{1} \mathrm{H}$ NMR ([D $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right):{ }^{84,85} \delta 0.25-0.41,0.50-0.69$, and $1.13-1.70\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right)$, $2.56\left(\mathrm{br}, \delta_{\mathrm{M}}\right), 2.61\left(\mathrm{br}, \delta_{\mathrm{N}}\right), 2.74\left(\delta_{\mathrm{C}}\right), 3.38\left(\delta_{\mathrm{A}}\right), 3.73\left(\delta_{\mathrm{B}}\right)$, and $9.6\left(\mathrm{br}, \delta_{\mathrm{G}}\right)\left(10 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-14.2 \mathrm{~Hz}\right.$, ${ }^{3} J_{\mathrm{AC}}=2.6 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=12.7 \mathrm{~Hz},{ }^{3} J_{\mathrm{GM}}$ and ${ }^{3} J_{\mathrm{GN}}$ not resolved, $\left.\mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N} H_{\mathrm{G}}\left(\mathrm{C}\left(H_{\mathrm{M}}\right)_{3}\right)\left(\mathrm{C}\left(H_{\mathrm{N}}\right)_{3}\right)\right)$, 3.71 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{OCH}_{3}$ ), 6.01 (s, $1 \mathrm{H}, \mathrm{SiOH}$ ), 6.83-6.91 (m, $2 \mathrm{H}, H-3 / H-5$, Aryl), 7.14-7.22 (m, $2 \mathrm{H}, H-$ $2 / \mathrm{H}-6$, Aryl). The ${ }^{13} \mathrm{C}$ and ${ }^{29} \mathrm{Si}$ NMR data were identical with those obtained for $\mathrm{rac} \mathbf{- 1 2 b} \cdot \mathrm{HCl}$. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{ClNO}_{2} \mathrm{Si}: \mathrm{C}, 58.25 ; \mathrm{H}, 8.55 ; \mathrm{N}, 4.25$. Found: C, $58.4 ; \mathrm{H}, 8.4 ; \mathrm{N}, 4.4$.

Protocol B. A 2.1 M ethereal hydrogen chloride solution ( $17.5 \mathrm{~mL}, 36.8 \mathrm{mmol}$ of HCl ) was added at $20{ }^{\circ} \mathrm{C}$ (water bath) to a stirred solution of $(R) \mathbf{- 1 2 b}(10.2 \mathrm{~g}, 34.8 \mathrm{mmol})$ in THF/dichloromethane $(9 / 1, \mathrm{v} / \mathrm{v})(228 \mathrm{~mL})$, and the resulting mixture was stirred moderately for 5 seconds and then cooled to $0{ }^{\circ} \mathrm{C}$ (spontaneous crystallization). The mixture was kept undisturbed at $0{ }^{\circ} \mathrm{C}$ for 1 h and then at $4^{\circ} \mathrm{C}$ for 16 h . The precipitate was isolated by suction filtration, washed with diethyl ether $(2 \times 40 \mathrm{~mL})$, and dried in vacuo $\left(0.001 \mathrm{mbar}, 2{ }^{\circ} \mathrm{C}, 4 \mathrm{~h}\right)$ to give $(R)-\mathbf{1 2 b} \cdot \mathrm{HCl}$ in $95 \%$ yield as a colorless crystalline solid ( $10.9 \mathrm{~g}, 33.0 \mathrm{mmol}$ ); mp $180-181^{\circ} \mathrm{C} ;[\alpha]_{589}^{20}=-29.3(c=$ $1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). The NMR data of the product were identical with those obtained for $(R) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ synthesized according to Protocol A. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{ClNO}_{2} \mathrm{Si}$ : C, $58.25 ; \mathrm{H}, 8.55$; N, 4.25. Found: C, 58.1; H, 8.5; N, 4.3.

Preparation of (R)-[2-(1-hydroxy-1-sila-1-cyclohexyl)-2-(4-methoxyphenyl)ethyl]dimethylammonium bromide $((\boldsymbol{R})$-sila-venlafaxine hydrobromide, $(\boldsymbol{R}) \mathbf{- 1 2 b} \cdot \mathbf{H B r})$. A solution of triphenylphosphonium bromide ( $586 \mathrm{mg}, 1.71 \mathrm{mmol}$ ) in dichloromethane $(10 \mathrm{~mL})$ was added at 20 ${ }^{\circ} \mathrm{C}$ in one single portion to a solution of $(R) \mathbf{- 1 2 b}(501 \mathrm{mg}, 1.71 \mathrm{mmol})$ in dichloromethane $(5 \mathrm{~mL})$. The resulting mixture was stirred at $20^{\circ} \mathrm{C}$ for 10 min , ethyl acetate was added ( 30 mL ), and the solvent was removed under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$ until a residual volume of 15 mL was obtained (partial precipitation of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ ). A further 30 mL of ethyl acetate were added, and the solution was concentrated again under reduced pressure (water bath, $5-15^{\circ} \mathrm{C}$ ) until a residual volume of 15 mL was obtained (almost quantitative precipitation of $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ ). The solvent was removed by decantation, and the precipitate was washed with diethyl ether ( $2 \times 10 \mathrm{~mL}$; separation by decantation), dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ), and then redissolved in
dichloromethane $(6 \mathrm{~mL})$. Upon vapor diffusion of diethyl ether into the resulting solution at $20^{\circ} \mathrm{C}$, crystals precipitated, which were isolated by filtration to give $(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}$ in $90 \%$ yield as a colorless crystalline solid ( $573 \mathrm{mg}, 1.53 \mathrm{mmol}$ ); mp $152-153{ }^{\circ} \mathrm{C}$; $[\alpha]_{589}^{20}=-20.8\left(c=2.50, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. ${ }^{1} \mathrm{H}$ NMR ([D $\left.\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta 0.26-0.43,0.50-0.70$, and $1.13-1.70\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 2.65(\mathrm{br} \mathrm{s}, 6 \mathrm{H}$, $\left.\mathrm{NCH}_{3}\right), 2.68\left(\delta_{\mathrm{C}}\right), 3.36\left(\delta_{\mathrm{A}}\right)$, and $3.79\left(\delta_{\mathrm{B}}\right)\left(3 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-13.6 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=2.9 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=13.3 \mathrm{~Hz}\right.$, $\mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}$ ), $3.72\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right.$ ), 5.9 (br s, $1 \mathrm{H}, \mathrm{SiOH}$ ), 6.84-6.92 (m, $2 \mathrm{H}, H-3 / H-5$, Aryl), 7.15-7.23 (m, $2 \mathrm{H}, \mathrm{H}-2 / H-6$, Aryl). ${ }^{13} \mathrm{C}$ NMR ( $\left.\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta 12.4\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 13.2\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 23.5$ $\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 23.7\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.1\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 30.7(\mathrm{SiCHC}), 40.8\left(\mathrm{NCH}_{3}\right), 43.8$ $\left(\mathrm{NCH}_{3}\right), 55.0\left(\mathrm{OCH}_{3}\right), 57.7\left(\mathrm{CCH}_{2} \mathrm{~N}\right), 114.1(\mathrm{C}-3 / \mathrm{C}-5$, Aryl), 128.8 (C-2/C-6, Aryl), $129.7(C-1$, Aryl), 157.3 (C-4, Aryl). ${ }^{29} \mathrm{Si}$ NMR ([ $\left.\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta 2.9$. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{BrNO}_{2} \mathrm{Si}: \mathrm{C}, 51.33$; H, 7.54; N, 3.74. Found: C, 51.0; H, 7.3; N, 3.8.

Preparation of (S)-[2-(1-hydroxy-1-sila-1-cyclohexyl)-2-(4-methoxyphenyl)ethyl]dimethylammonium chloride $((S)$-sila-venlafaxine hydrochloride, $\quad(S) \mathbf{- 1 2 b} \cdot \mathbf{H C l})$. This compound was prepared from $(S) \mathbf{- 1 2 b}$ analogous to the protocols used for the preparation of $(R)$ 12b $\cdot \mathrm{HCl}$.

Protocol A. Compound $(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ was synthesized from $(S) \mathbf{- 1 2 b}(1.00 \mathrm{~g}, 3.41 \mathrm{mmol})$ and isolated in $92 \%$ yield as a colorless crystalline solid ( $1.03 \mathrm{~g}, 3.12 \mathrm{mmol}$ ); mp $174{ }^{\circ} \mathrm{C}$; $[\alpha]_{589}^{20}=+29.3$ ( $c=1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). The NMR data of the product were identical with those obtained for $(R)-$ 12b $\cdot \mathrm{HCl}$. Anal. Calcd for $\mathrm{C}_{16} \mathrm{H}_{28} \mathrm{ClNO}_{2} \mathrm{Si}$ : C, 58.25 ; H, 8.55; N, 4.25. Found: C, 58.0; H, 8.2; N, 4.0.

Protocol B. Compound $(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ was synthesized from $(S) \mathbf{- 1 2 b}(8.95 \mathrm{~g}, 30.5 \mathrm{mmol})$ and isolated in $89 \%$ yield as a colorless crystalline solid $(8.93 \mathrm{~g}, 27.1 \mathrm{mmol}) ; \mathrm{mp} 180-181{ }^{\circ} \mathrm{C} ;[\alpha]_{589}^{20}=$ $+29.3\left(c=1.00, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. ## Preparation of [2-(1-hydroxy-1-sila-1-cyclopentyl)-2-(4-methoxyphenyl)ethyl]dimethyl-

 ammonium chloride ( $\mathbf{r a c} \mathbf{- 1 3} \cdot \mathbf{H C l}$ ). A 2 M ethereal hydrogen chloride solution ( $2.0 \mathrm{~mL}, 4.0 \mathrm{mmol}$ of $\mathbf{H C l})$ was added at $20^{\circ} \mathrm{C}$ in one single portion to a stirred solution of $\mathrm{rac}-\mathbf{1 3}(1.02 \mathrm{~g}, 3.65 \mathrm{mmol})$ in dichloromethane ( 16 mL ). The mixture was kept undisturbed at $-27^{\circ} \mathrm{C}$ for 2 h , and a few seed crystals (obtained from $20 \mu \mathrm{~L}$ of the reaction mixture by slow evaporation of the solvent at $20^{\circ} \mathrm{C}$, followed by cooling of the resulting oil to $-27^{\circ} \mathrm{C}$ ) were added. The resulting mixture was kept undisturbed at $-27^{\circ} \mathrm{C}$ for three days, and the precipitate was isolated by filtration at $-27^{\circ} \mathrm{C}$, washed with ice-cold acetone ( 10 mL ) and then dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give $\mathrm{rac}-\mathbf{1 3} \cdot \mathrm{HCl}$ in $52 \%$ yield as a colorless crystalline solid ( $598 \mathrm{mg}, 1.89 \mathrm{mmol}$ ) ; mp $153-154{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ([ $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta 0.18-0.62\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.06-1.27$ and $1.32-1.55\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 2.6$ (br s, $\left.6 \mathrm{H}, \mathrm{NCH}_{3}\right), 2.82\left(\delta_{\mathrm{C}}\right), 3.43\left(\delta_{\mathrm{A}}\right)$, and $3.82\left(\delta_{\mathrm{B}}\right)\left(3 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-13.5 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=2.6 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=\right.$ $12.7 \mathrm{~Hz}, \mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}$ ), $3.71\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH} H_{3}\right), 6.2(\mathrm{br} \mathrm{s}, 1 \mathrm{H}, \mathrm{SiOH}), 6.82-6.90(\mathrm{~m}, 2 \mathrm{H}, H-3 / H-5$, Aryl), 7.17-7.25 (m, $2 \mathrm{H}, H-2 / H-6$, Aryl), 9.5 (br s, $1 \mathrm{H}, \mathrm{NH}) .{ }^{13} \mathrm{C}$ NMR ([D $\left.\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta 10.4$ $\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 10.9\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 25.36\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 25.43\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 31.7(\mathrm{SiCHC} 2), 41.5\left(\mathrm{NCH}_{3}\right)$, $43.1\left(\mathrm{NCH}_{3}\right), 55.0\left(\mathrm{OCH}_{3}\right), 57.5\left(\mathrm{CCH}_{2} \mathrm{~N}\right), 114.1(C-3 / C-5$, Aryl), $128.9(C-2 / C-6$, Aryl), $130.0(C-$ 1, Aryl), 157.3 (C-4, Aryl). ${ }^{29} \mathrm{Si}$ NMR ([ $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta 25.1$. Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{ClNO}_{2} \mathrm{Si}: \mathrm{C}$, $57.03 ; \mathrm{H}, 8.30 ; \mathrm{N}, 4.43$. Found: C, 56.6; H, 7.9; N, 4.4.Preparation of rac-1-[2-(dimethylamino)-1-phenylethyl]-1-silacyclohexan-1-ol (rac-desmethoxy-sila-venlafaxine, rac-15). A solution of $\mathbf{r a c} \mathbf{- 8 0}(7.88 \mathrm{~g}, 27.1 \mathrm{mmol})$ in diethyl ether $(50 \mathrm{~mL})$ was added in one single portion at $0^{\circ} \mathrm{C}$ to a stirred two-phase mixture of diethyl ether ( 50 mL ) and 2 M potassium acetate/acetic acid buffer ( $\mathrm{pH} 4.5,150 \mathrm{~mL}$ ). The pH of the aqueous phase changed to pH ca. 7 within 10 min and was readjusted to pH 5.0 by addition of small portions of glacial acetic acid. The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 1 h , with the pH of the aqueous phase remaining constantly at pH 5.0 during this time. The aqueous layer was separated, the organic phase was extracted with 1 M potassium acetate/acetic acid buffer ( pH 5.0 ) $(3 \times 100 \mathrm{~mL})$, and the aqueous solutions were combined. Diethyl ether ( 50 mL ) was added, and the pH of the aqueous phase was adjusted to pH 10.5 by addition of small portions of a saturated aqueous potassium carbonate solution. The organic layer was separated, the aqueous phase was extracted with diethyl
ether $(5 \times 100 \mathrm{~mL})$, and the organic extracts were combined, followed by addition of $n$-hexane ( 200 $\mathrm{mL})$. The solvent was removed under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$ until a residual volume of 150 mL was obtained, whereupon residual water separated from the organic phase (formation of a two-phase system). The organic layer was separated, the aqueous phase was extracted with $n$-hexane ( $2 \times 100 \mathrm{~mL}$ ), and the organic solutions were combined. The solvent was removed completely under reduced pressure in a water bath $\left(5-15{ }^{\circ} \mathrm{C}\right)$ to give a colorless oil. Crystallization of this oil from $n$-pentane $(120 \mathrm{~mL})$ at $4^{\circ} \mathrm{C}$ over a period of 1 day and then at -20 ${ }^{\circ} \mathrm{C}$ for a further 6 days afforded rac- $\mathbf{1 5}$ in $91 \%$ yield as a colorless crystalline solid $(6.50 \mathrm{~g}, 24.7$ mmol ) (isolated by quick decantation of the cold solvent, followed by drying in vacuo ( 0.001 mbar , $\left.20^{\circ} \mathrm{C}, 6 \mathrm{~h}\right)$ ); mp $63{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.45-0.78$ and $1.00-1.69\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 2.30(\mathrm{~s}$, $\left.6 \mathrm{H}, \mathrm{NCH}_{3}\right), 2.54\left(\delta_{\mathrm{C}}\right), 2.58\left(\delta_{\mathrm{A}}\right)$, and $3.16\left(\delta_{\mathrm{B}}\right),\left(3 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-12.0 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=5.3 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=12.1\right.$ $\mathrm{Hz}, \mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}$ ), 5.1 (br s, $1 \mathrm{H}, \mathrm{SiOH}$ ), 7.03-7.09 (m, $2 \mathrm{H}, H-2 / H-6$, Aryl), 7.09-7.14 (m, 1 H , $H-4$, Aryl), 7.20-7.29 (m, $2 \mathrm{H}, H-3 / H-5$, Aryl). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 12.5\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 14.5$ $\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 24.5\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 24.6\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.9\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 34.3\left(\mathrm{SiCHC}_{2}\right), 45.5$ $\left(\mathrm{NCH}_{3}\right), 61.6\left(\mathrm{NCH}_{2} \mathrm{C}\right), 125.2$ (C-4, Aryl), 127.9 (C-2/C-6, Aryl), 128.6 (C-3/C-5, Aryl), 141.9 (C1, Aryl). ${ }^{29}$ Si NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 9.5$. Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{25} \mathrm{NOSi}: \mathrm{C}, 68.39 ; \mathrm{H}, 9.56 ; \mathrm{N}, 5.32$. Found: C, 68.0; H, 9.7; N, 5.5.

Preparation of rac-[2-(1-hydroxy-1-sila-1-cyclohexyl)-2-phenylethyl]dimethylammonium chloride (rac-desmethoxy-sila-venlafaxine hydrochloride, rac-15•HCl). A 2 M ethereal hydrogen chloride solution ( $10.5 \mathrm{~mL}, 21.0 \mathrm{mmol}$ of HCl ) was added in one single portion at $20^{\circ} \mathrm{C}$ to a stirred solution of $\mathrm{rac}-\mathbf{1 5}(5.27 \mathrm{~g}, 20.0 \mathrm{mmol})$ in dichloromethane $(50 \mathrm{~mL})$. The resulting solid was dissolved in dichloromethane $(150 \mathrm{~mL})$ at reflux temperature, and the solution was then kept undisturbed at $4{ }^{\circ} \mathrm{C}$ for 1 day and at $-20^{\circ} \mathrm{C}$ for a further 3 days. The precipitate was isolated by filtration at $-20^{\circ} \mathrm{C}$, washed with diethyl ether ( 20 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give $\mathrm{rac}-\mathbf{1 5} \cdot \mathrm{HCl}$ in $93 \%$ yield (including workup of the mother liquor) as a colorless crystalline solid ( $5.60 \mathrm{~g}, 18.7 \mathrm{mmol}$ ); mp 186-187 ${ }^{\circ} \mathrm{C}$ (dec.). ${ }^{1} \mathrm{H}$ NMR ( $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta 0.24-0.41,0.51-0.71$, and $1.12-1.59\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 2.56\left(\delta_{\mathrm{M}}\right), 2.61\left(\delta_{\mathrm{N}}\right), 2.83\left(\delta_{\mathrm{C}}\right), 3.42\left(\delta_{\mathrm{A}}\right), 3.81\left(\delta_{\mathrm{B}}\right)$, and $9.8(\mathrm{br}$, $\left.\delta_{\mathrm{G}}\right)\left(10 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-13.1 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=2.5 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=12.5 \mathrm{~Hz},{ }^{3} J_{\mathrm{GM}}\right.$ and ${ }^{3} J_{\mathrm{GN}}$ not resolved, $\left.\mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N} H_{\mathrm{G}}\left(\mathrm{C}\left(H_{\mathrm{M}}\right)_{3}\right)\left(\mathrm{C}\left(H_{\mathrm{N}}\right)_{3}\right)\right), 6.06(\mathrm{~s}, 1 \mathrm{H}, \mathrm{SiOH}), 7.11-7.19(\mathrm{~m}, 1 \mathrm{H}, H-4$, Aryl), 7.237.34 (m, $4 \mathrm{H}, H-2 / H-6, H-3 / H-5$, Aryl). ${ }^{13} \mathrm{C}$ NMR ([D $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta 12.3\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 13.2\left(\mathrm{SiCH}_{2} \mathrm{C}\right)$, $23.6\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 23.7\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.1\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 32.1(\mathrm{SiCHC} 2), 41.6\left(\mathrm{NCH}_{3}\right), 42.9$ $\left(\mathrm{NCH}_{3}\right), 57.3\left(\mathrm{CCH}_{2} \mathrm{~N}\right), 125.4$ (C-4, Aryl), 127.7 (C-2/C-6, Aryl), 128.5 (C-3/C-5, Aryl), 139.1 (C-

1, Aryl). ${ }^{29} \mathrm{Si}$ NMR ([ $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): ~ \delta 2.8$. Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{ClNOSi}: \mathrm{C}, 60.07 ; \mathrm{H}, 8.74 ; \mathrm{N}, 4.67$. Found: C, 60.0; H, 8.9; N, 4.8.

Preparation of rac-1-(dimethylamino)-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-
1-silacyclohexane (rac-16). A 1.6 M solution of $n$-butyllithium in $n$-hexane $(9.5 \mathrm{~mL}, 15.2 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise at $-50^{\circ} \mathrm{C}$ within 5 min to a stirred solution of dimethylamine $(5.51 \mathrm{~g}$, 122 mmol ) in THF ( 150 mL ). The resulting mixture was warmed to $-15^{\circ} \mathrm{C}$ within 4 h and then cooled to $-35{ }^{\circ} \mathrm{C}$, followed by dropwise addition of $\mathbf{6 0}(3.20 \mathrm{~g}, 13.8 \mathrm{mmol})$ within 10 min (evolution of hydrogen; rise in temperature from -35 to $-30^{\circ} \mathrm{C}$ ). The resulting yellow solution was stirred at $-30^{\circ} \mathrm{C}$ for 3 h and then kept undisturbed at $-26^{\circ} \mathrm{C}$ for 16 h . Subsequently, the solution was placed in an ice bath and stirred again, followed by addition of chlorotrimethylsilane $(1.72 \mathrm{~g}$, 15.8 mmol ) in one single portion (change of color from yellow to colorless). The mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min , and the solvent was removed completely under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$, followed by addition of $n$-hexane ( 40 mL ). The mixture was stirred at $20^{\circ} \mathrm{C}$ for 30 min , the resulting precipitate was separated by filtration, and the filter cake was washed with $n$-hexane ( 20 mL ). The filtrate and the wash solution were combined, the solvent was removed completely under reduced pressure in a water bath $\left(5-15^{\circ} \mathrm{C}\right)$, and the residue was distilled in vacuo (Vigreux column, 5 cm ) to give $\mathrm{rac}-16$ in $76 \%$ yield as a colorless oily liquid ( $3.37 \mathrm{~g}, 10.5 \mathrm{mmol}$ ); bp $115-118{ }^{\circ} \mathrm{C} / 0.003 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR ( $\left[\mathrm{D}_{8}\right] \mathrm{THF}$ ): $\delta 0.35-0.75,0.84-0.97$, and $1.12-1.79(\mathrm{~m}, 10 \mathrm{H}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 2.12\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{CNCH}_{3}\right), 2.34\left(\delta_{\mathrm{C}}\right), 2.618\left(\delta_{\mathrm{A}}\right)$, and $2.623\left(\delta_{\mathrm{B}}\right)\left(3 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=0.0 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=\right.$ $\left.7.8 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=9.2 \mathrm{~Hz}, \mathrm{SiCH}_{\mathrm{C}} \mathrm{C} H_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}\right), 2.44\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiNCH}_{3}\right), 3.71\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH} H_{3}\right), 6.71-6.78(\mathrm{~m}$, $2 \mathrm{H}, H-3 / H-5$, Aryl), 6.89-6.96 (m, $2 \mathrm{H}, H-2 / H-6$, Aryl). ${ }^{13} \mathrm{C}$ NMR ([D $\left.\mathrm{D}_{8}\right] \mathrm{THF}$ ): $\delta 12.0\left(\mathrm{SiCH}_{2} \mathrm{C}\right)$, $12.8\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 24.9\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 25.0\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 31.1\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 36.1(\mathrm{SiCHC} 2), 38.7$ $\left(\mathrm{SiNCH}_{3}\right), 45.7\left(\mathrm{CNCH}_{3}\right)$, $55.1\left(\mathrm{OCH}_{3}\right), 61.6\left(\mathrm{CCH}_{2} \mathrm{~N}\right), 114.0(\mathrm{C}-3 / C-5$, Aryl), $129.4(C-2 / C-6$, Aryl), 135.4 ( $C-1$, Aryl), 159.2 ( $C-4$, Aryl). ${ }^{29} \mathrm{Si}$ NMR ( $\left[\mathrm{D}_{8}\right] \mathrm{THF}$ ): $\delta 0.8$. ## Preparation of rac-1-[2-(dimethylamino)-1-(4-methoxyphenyl)ethyl]-1-silacyclohexane

( $\mathbf{r a c} \mathbf{- 1 8}$ ). A solution of $\mathrm{rac}-\mathbf{1 7}(3.48 \mathrm{~g}, 11.3 \mathrm{mmol})$ in diethyl ether $(10 \mathrm{~mL})$ was added at $20^{\circ} \mathrm{C}$ within 10 min to a suspension of lithium aluminum hydride (LAH) $(253 \mathrm{mg}, 6.67 \mathrm{mmol})$ in diethyl ether ( 50 mL ). The mixture was heated under reflux for 90 min and then cooled to $20^{\circ} \mathrm{C}$, the solid was removed by filtration, and the filter cake was washed with diethyl ether ( 10 mL ). The filtrate and the wash solution were combined, chlorotrimethylsilane ( $123 \mathrm{mg}, 1.13 \mathrm{mmol}$ ) was added at 20 ${ }^{\circ} \mathrm{C}$, and the resulting mixture was stirred at $20^{\circ} \mathrm{C}$ for 30 min (a drop of the mixture gave a strongly acidic reaction on wet pH indicator paper, thus ensuring that any basic impurities were absent). The solvent was removed under reduced pressure, followed by addition of $n$-pentane $(40 \mathrm{~mL})$ to the residue and subsequent filtration. The filter cake was washed with $n$-pentane ( 10 mL ), the filtrate and the wash solution were combined, and the solvent was removed under reduced pressure. The residue was distilled in vacuo (Vigreux column, 5 cm ) to give rac-18 in $73 \%$ yield as a colorless oily liquid ( $2.28 \mathrm{~g}, 8.22 \mathrm{mmol}$ ); bp $110-113 \mathrm{C} / 0.001 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.31-0.67,0.75-$ $0.89,1.08-1.28,1.35-1.58$, and $\left.1.67-1.85\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 2.16(\mathrm{~s}, 6 \mathrm{H}, \mathrm{NCH})_{3}\right), 2.46\left(\delta_{\mathrm{C}}\right), 2.52$ $\left(\delta_{\mathrm{A}}\right)$, and $2.82\left(\delta_{\mathrm{B}}\right)\left(3 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=-11.7 \mathrm{~Hz},{ }^{3} J_{\mathrm{AC}}=5.9 \mathrm{~Hz},{ }^{3} J_{\mathrm{BC}}=10.1 \mathrm{~Hz}, \mathrm{SiCH}_{\mathrm{C}} \mathrm{C} H_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}\right), 3.69-$ 3.80 (m, $1 \mathrm{H}, \mathrm{Si} H$ ), 3.75 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{OCH}_{3}$ ), 6.76-6.83 (m, $2 \mathrm{H}, \mathrm{H}-3 / \mathrm{H}-5$, Aryl), 6.94-7.02 (m, $2 \mathrm{H}, \mathrm{H}-$ 2/H-6, Aryl). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 8.9\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 9.8\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 24.83\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 24.84$ $\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.6\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 31.2\left(\mathrm{SiCHC}_{2}\right), 45.4\left(\mathrm{NCH}_{3}\right), 55.1\left(\mathrm{OCH}_{3}\right), 61.1\left(\mathrm{CCH}_{2} \mathrm{~N}\right)$, 113.9 (C-3/C-5, Aryl), 128.2 (C-2/C-6, Aryl), 134.1 (C-1, Aryl), 156.9 ( $C-4$, Aryl). ${ }^{29}$ Si NMR $\left(\mathrm{CDCl}_{3}\right): \delta-9.0$. Preparation of 4-[1-(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)vinyl]benzoic acid (disila-bexarotene, 21b). A mixture of methanol ( 120 mL ), water ( 40 mL ), potassium hydroxide ( $5.54 \mathrm{~g}, 98.7 \mathrm{mmol}$ ), and $\mathbf{8 9}(3.94 \mathrm{~g}, 9.98 \mathrm{mmol})$ was heated under reflux for 45 min (slow dissolution of $\mathbf{8 9}$, quantitative conversion $\mathbf{8 9} \rightarrow \mathbf{2 1 b}$ (HPLC)). The mixture was cooled in an ice bath, followed by addition of dichloromethane ( 100 mL ), and the aqueous phase was acidified to ca. pH 1 by addition of 1 M hydrochloric acid ( 130 mL ) (formation of a precipitate). The ice bath was removed, and the mixture was stirred at $20^{\circ} \mathrm{C}$ for 5 min (dissolution of the precipitate). The organic phase was separated, the aqueous layer was extracted with dichloromethane $(3 \times 100 \mathrm{~mL})$, and the organic extracts were combined and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the residue was dried in vacuo ( $10 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give 3.73 g of a white amorphous solid. This solid was dissolved in diethyl ether ( 85 mL ), and 21b was crystallized at $20^{\circ} \mathrm{C}$ by vapor diffusion of $n$-pentane into this solution over a period of 2 weeks. The precipitate was isolated by decantation of the solvent,
washed with $n$-pentane ( $2 \times 20 \mathrm{~mL}$ ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 21b in $96 \%$ yield as a colorless crystalline solid ( $3.65 \mathrm{~g}, 9.59 \mathrm{mmol}$ ); mp $221{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta$ $0.23\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.26\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 1.05\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 2.00-2.02\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{CCH}_{3}\right), 5.35$ $\left(\mathrm{d},{ }^{2} J_{\mathrm{HH}}=1.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 5.91\left(\mathrm{~d},{ }^{2} J_{\mathrm{HH}}=1.1 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right), 7.32-7.34(\mathrm{~m}, 1 \mathrm{H}, H-$ 4, Naph), 7.35 (br "s", 1 H, H-1, Naph), 7.37-7.43 (m, 2 H, H-3/H-5, Phe), 8.01-8.07 (m, 2 H, $H-$ $2 / H-6$, Phe), 11.4 (br s, $1 \mathrm{H}, \mathrm{C}(\mathrm{O}) \mathrm{OH}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-1.41\left(2 \mathrm{C}, \mathrm{SiCH}_{3}\right),-1.39(2 \mathrm{C}$, $\mathrm{SiCH} 3), 7.87\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 7.89\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 20.2\left(\mathrm{CCH}_{3}\right), 117.7\left(\mathrm{C}=\mathrm{CH}_{2}\right), 127.0(C-3 / C-5$, Phe $), 128.5$ ( $C-1$, Phe), 130.6 ( $C-2 / C-6$, Phe), 135.2 ( $C-1$, Naph), 135.7 ( $C-4$, Naph), 136.0 ( $C-3$, Naph), 141.0 ( $C$-2, Naph), 143.3 ( $C-4 \mathrm{a}, \mathrm{Naph}$ ), 145.8 ( $C$-8a, Naph), 146.5 ( $C-4$, Phe), $149.3\left(C=\mathrm{CH}_{2}\right), 172.2$ $(C(\mathrm{O}) \mathrm{OH}) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-7.03,-6.98$. Anal. Calcd for $\mathrm{C}_{22} \mathrm{H}_{28} \mathrm{O}_{2} \mathrm{Si}_{2}: \mathrm{C}, 69.42 ; \mathrm{H}, 7.41$. Found: C, 69.2; H, 7.4.

Preparation of $5-[(3,5,5,8,8$-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)-methyl]- $N$-(2,4,6-trimethoxyphenyl)furan-2-carboxamide (disila-AG-045572, 22b).

Protocol A. Solution I. A solution of $\mathbf{9 9}(1.00 \mathrm{~g}, 2.79 \mathrm{mmol})$ and thionyl chloride $(6.85 \mathrm{~g}$, $57.6 \mathrm{mmol})$ in dichloromethane ( 9 mL ) was heated under reflux for 5 h . All volatile components were removed in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ), and the oily residue was redissolved in dichloromethane ( 4 mL ).

Solution II. Compound 101 ( $572 \mathrm{mg}, 3.12 \mathrm{mmol}$; freshly distilled by bulb-to-bulb distillation directly before use), pyridine ( $245 \mathrm{mg}, 3.10 \mathrm{mmol}$ ), and 4-(dimethylamino)pyridine (DMAP; 7.0 $\mathrm{mg}, 57 \mu \mathrm{~mol})$ were dissolved in dichloromethane ( 5 mL ).

Solution I was added dropwise at $0^{\circ} \mathrm{C}$ within 10 min to the stirred solution II (formation of a precipitate which redissolved later; change of color from colorless to orange). The mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for a further 10 min and then at $20^{\circ} \mathrm{C}$ for 16 h , followed by addition of dichloromethane $(20 \mathrm{~mL})$. The resulting solution was washed successively with a 5 vol- $\%$ aqueous acetic acid solution (solution A, 20 mL ), a half-saturated aqueous sodium hydrogen carbonate solution (solution B, 20 mL ), and water (solution C, 20 mL ). The first aqueous wash solution (A) was extracted with dichloromethane ( 20 mL ), the resulting organic extract was used to extract the second aqueous wash solution (B), the resulting organic extract was used to extract the third aqueous wash solution (C), and the organic extract was separated, followed by a second extraction of the aqueous wash solutions $\mathrm{A}, \mathrm{B}$ and C with a fresh portion of dichloromethane ( 20 mL ), using the same protocol as described for the first extraction sequence. The combined organic extracts were dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $10 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 30 \mathrm{~min}$ ) and then purified by column chromatography on silica gel (column dimensions, $66 \times 3.5 \mathrm{~cm}$; silica gel (15-40 $\mu \mathrm{m}$, Merck 1.15111 ), 235 g ;
eluent, ethyl acetate $/ n$-hexane ( $55: 45, \mathrm{v} / \mathrm{v}$ )). The relevant fractions (TLC control) were combined, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $0.01 \mathrm{mbar}, 20$ ${ }^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give 548 mg of an oil which was dissolved in diethyl ether ( 5 mL ). The product crystallized from the resulting solution at $4{ }^{\circ} \mathrm{C}$ within 7 days, and the precipitate was isolated by decantation, washed with $n$-pentane ( 2 mL ), and dried in vacuo ( $0.01 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 22b in $22 \%$ yield as a colorless crystalline solid ( $318 \mathrm{mg}, 607 \mu \mathrm{~mol}$ ); mp 139-140 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right)$ : $\delta 0.38\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.39\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 1.15\left(" \mathrm{~s} ", 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 2.14\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CCH} \mathrm{H}_{3}\right), 3.45(\mathrm{~s}$, $6 \mathrm{H}, o-\mathrm{OCH}_{3}$, Tri), 3.51 (s, $3 \mathrm{H}, p-\mathrm{OCH} H_{3}$, Tri), 3.70 (br "s", $2 \mathrm{H}, \mathrm{CCH} \mathrm{C}_{2} \mathrm{C}$ ), $5.61\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=3.4 \mathrm{~Hz}, 1\right.$ H, $H-4, \mathrm{Fu}(=$ furyl) $), 6.23\left(\mathrm{~s}, 2 \mathrm{H}, H-3 / H-5\right.$, Tri), $7.14\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=3.4 \mathrm{~Hz}, 1 \mathrm{H}, H-3, \mathrm{Fu}\right), 7.41(\mathrm{~s}, 1 \mathrm{H}$, $H-1, N a p h), 7.46$ (s, $1 \mathrm{H}, H-4, \mathrm{Naph}), 7.5$ (br s, $1 \mathrm{H}, \mathrm{N} H) .{ }^{13} \mathrm{C}$ NMR $\left.\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-1.31(2 \mathrm{C}, \mathrm{SiCH})_{3}\right)$, $-1.28\left(2 \mathrm{C}, \mathrm{SiCH}_{3}\right), 8.00\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 8.01\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 19.3\left(\mathrm{CCH}_{3}\right), 32.6\left(\mathrm{CCH}_{2} \mathrm{C}\right), 55.0\left(p-\mathrm{OCH}_{3}\right.$, Tri), $55.5\left(o-\mathrm{OCH}_{3}\right.$, Tri), 91.5 ( $C-3 / C-5$, Tri), 108.0 ( $C-1$, Tri), 109.1 ( $C-4, \mathrm{Fu}$ ), 115.4 ( $C-3, \mathrm{Fu}$ ), 135.2 (C-1, Naph), 135.7 (C-2, Naph), 135.9 (C-4, Naph), 136.7 (C-3, Naph), 143.3 (C-4a, Naph), 144.3 ( $C-8 \mathrm{a}, \mathrm{Naph}$ ), 148.4 ( $C-2, \mathrm{Fu}$ ), 156.1 ( $C-5, \mathrm{Fu}$ ), 156.6 ( $C(\mathrm{O}) \mathrm{N})$, 157.3 ( $C-2 / C-6$, Tri), 160.4 (C-4, Tri). ${ }^{15} \mathrm{~N}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-281.8 .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-7.34,-7.30$. Anal. Calcd for $\mathrm{C}_{28} \mathrm{H}_{37} \mathrm{NO}_{5} \mathrm{Si}_{2}$ : C, 64.21; H, 7.12; N, 2.67. Found: C, 64.6; H, 7.1; N, 2.7.

Protocol B. A solution of $\mathbf{9 9}(584 \mathrm{mg}, 1.63 \mathrm{mmol})$ in dichloromethane $(10 \mathrm{~mL})$ was added dropwise at $20^{\circ} \mathrm{C}$ within 10 min to a stirred solution of dicyclohexylcarbodiimide (DCC; 370 mg , 1.79 mmol ) and pyridine ( $265 \mathrm{mg}, 3.35 \mathrm{mmol}$ ) in dichloromethane $(10 \mathrm{~mL})$. The mixture was stirred at $20^{\circ} \mathrm{C}$ for a further 24 h , followed by addition of DMAP ( $4.0 \mathrm{mg}, 33 \mu \mathrm{~mol}$ ) in one single portion. Subsequently, a solution of $\mathbf{1 0 1}(358 \mathrm{mg}, 1.95 \mathrm{mmol}$; freshly distilled by bulb-to-bulb distillation directly before use) in dichloromethane ( 5 mL ) was added to the stirred mixture at $20^{\circ} \mathrm{C}$ within 10 min , and stirring was continued at $20^{\circ} \mathrm{C}$ for a further 3 days (formation of a precipitate). The mixture was washed with water $(2 \times 25 \mathrm{~mL})$, and the organic layer was separated. The first aqueous wash solution (A) was extracted with dichloromethane ( 20 mL ), the resulting organic extract was used to extract the second aqueous wash solution (B), and the organic extract was separated, followed by a second extraction of the aqueous wash solutions $A$ and $B$ with a fresh portion of dichloromethane ( 20 mL ), using the same protocol as described for the first extraction sequence, and all organic extracts were combined and dried over anhydrous sodium sulfate (remaining solids that did not dissolve in neither phase were filtered off along with the sodium sulfate). The solvent was removed under reduced pressure, and the residue was dried in vacuo ( 10 mbar, $20^{\circ} \mathrm{C}, 30 \mathrm{~min}$ ) and then purified by column chromatography on silica gel (column dimensions, $70 \times 3.5 \mathrm{~cm}$; silica gel ( $15-40 \mu \mathrm{~m}$, Merck 1.15111 ), 250 g ; eluent, ethyl acetate $/ n-$ hexane (55:45, v/v)). The relevant fractions (TLC control) were combined, the solvent was removed
under reduced pressure, and the residue was dried in vacuo ( $0.01 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give 454 mg of an oil which was dissolved in diethyl ether $(8 \mathrm{~mL})$. The resulting solution was then kept undisturbed at $4{ }^{\circ} \mathrm{C}$ for 2 days and at $-20^{\circ} \mathrm{C}$ for a further 4 days (formation of a precipitate). The precipitate was isolated by decantation, washed with $n$-pentane ( 3 mL ), and dried in vacuo ( 0.01 mbar, $20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 22b in $37 \%$ yield as a colorless crystalline solid ( $318 \mathrm{mg}, 607 \mu \mathrm{~mol}$ ); mp $139{ }^{\circ} \mathrm{C}$. The NMR data of the product $\left({ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}\right)$ were identical with those obtained for the product prepared according to Protocol A (see above). Anal. Calcd for $\mathrm{C}_{28} \mathrm{H}_{37} \mathrm{NO}_{5} \mathrm{Si}_{2}$ : C, 64.21; H , 7.12; N, 2.67. Found: C, 64.2; H, 7.1; N, 2.7.

Protocol C. A 2.0 M solution of trimethylaluminum in toluene $(5.00 \mathrm{~mL}, 10.0 \mathrm{mmol}$ of $\left.\mathrm{AlMe}_{3}\right)$ was added dropwise at $-30^{\circ} \mathrm{C}$ within 8 min to a stirred suspension of $\mathbf{1 0 1} \cdot \mathrm{HCl}(2.20 \mathrm{~g}, 10.0$ $\mathrm{mmol})$ in toluene $(20 \mathrm{~mL})$ (dissolution of $\mathbf{1 0 1} \cdot \mathrm{HCl}$, followed by the formation of a precipitate). The stirred mixture was warmed to $-20^{\circ} \mathrm{C}$ within 25 min and then to $20^{\circ} \mathrm{C}$ within a further 1 h (dissolution of the precipitate), and the resulting solution was then added dropwise at $0^{\circ} \mathrm{C}$ within 10 min to a stirred solution of $98(1.86 \mathrm{~g}, 4.99 \mathrm{mmol})$ in dichloromethane $(20 \mathrm{~mL})$. The resulting mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for a further 1 h and then at $20^{\circ} \mathrm{C}$ for 3 days (quantitative conversion (HPLC control), change of color from colorless to black), followed by addition of a half-saturated aqueous ammonium acetate solution (solution A, 100 mL ) (formation of a precipitate). The precipitate was separated by filtration and washed with ethyl acetate $(5 \times 20 \mathrm{~mL})$, the filtrate and the wash solutions were combined, and the organic layer was separated and washed with water (solution B, 100 mL ). The first aqueous wash solution (A) was extracted with ethyl acetate ( 50 mL ), the resulting organic extract was used to extract the second aqueous wash solution (B), and the organic extract was separated, followed by a second and third extraction of the aqueous wash solutions A and B with fresh portions of ethyl acetate $(2 \times 50 \mathrm{~mL})$, using the same protocol as described for the first extraction sequence. The combined organic extracts were dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure, and the residue ( 4.0 g of a dark brown viscous oil) was purified by column chromatography on silica gel (column dimensions, $80 \times 3.0 \mathrm{~cm}$; silica gel (32-63 $\mu \mathrm{m}$, ICN 02826 ), 230 g ; eluent, ethyl acetate $/ n$-hexane (55:45, v/v)). The relevant fractions (TLC control) were combined, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give 2.77 g of a brown oil. The product was crystallized and then recrystallized from diethyl ether ( 54 mL for each crystallization (sonication was necessary to achieve complete dissolution); crystallization at $4{ }^{\circ} \mathrm{C}$ over a period of 1 day and then at $-20^{\circ} \mathrm{C}$ over a period of 3 days). The crystalline solid was isolated by decantation, washed with $n$-pentane ( 5 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 1.58 g of $\mathbf{2 2 b}$. The solvent of the combined mother liquors was removed to yield 1.06 g of a brown
oily product which was crystallized twice from diethyl ether ( 19 mL ) to give a further 580 mg of 22b. Compound 22b was obtained in a total yield of $83 \%$ as a colorless crystalline solid $(2.16 \mathrm{~g}$, $4.12 \mathrm{mmol})$; mp $139{ }^{\circ} \mathrm{C}$. The NMR data of the product ( $\left.{ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{29} \mathrm{Si}\right)$ were identical with those obtained for the product prepared according to Protocol A (see above). Anal. Calcd for $\mathrm{C}_{28} \mathrm{H}_{37} \mathrm{NO}_{5} \mathrm{Si}_{2}$ : C, 64.21; H, 7.12; N, 2.67. Found: C, 64.2; H, 7.1; N, 2.7.

Preparation of chlorotris(chloromethyl)silane (23). A 2.0 M ethereal hydrogen chloride solution ( $24.0 \mathrm{~mL}, 48 \mathrm{mmol}$ of HCl ) was added dropwise at $0{ }^{\circ} \mathrm{C}$ within 2 min to a stirred suspension of $\mathbf{1 0 3}(14.4 \mathrm{~g}, 41.9 \mathrm{mmol})$ in diethyl ether ( 10 mL ), and the resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 1 min . After the cooling bath was removed, the temperature increased to $20^{\circ} \mathrm{C}$ within ca. 5 min (concomitant dissolution of 103), and the mixture was stirred at this temperature for a further 20 min (quantitative conversion $\mathbf{1 0 3} \boldsymbol{\rightarrow} \mathbf{2 3}$ (GC control)). The solvent was removed under reduced pressure, the residue was distilled in vacuo (Vigreux column, 5 cm ) to remove most of the 1,3,5-trimethoxybenzene formed, and the fraction boiling at $86-117^{\circ} \mathrm{C} / 1 \mathrm{mbar}$ was collected $(8.1 \mathrm{~g})$ and then redistilled in vacuo (Vigreux column, 13 cm ) to give $\mathbf{2 3}$ in $\mathbf{6 5 \%}$ yield as a colorless liquid ( $5.77 \mathrm{~g}, 27.2 \mathrm{mmol}$ ); bp $85{ }^{\circ} \mathrm{C} / 1 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 2.70\left(\mathrm{~s}, \mathrm{SiCH}_{2} \mathrm{Cl}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 24.8\left(\mathrm{SiCH}_{2} \mathrm{Cl}\right) .{ }^{29} \mathrm{Si} \mathrm{NMR}\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 10.5$. Preparation of the $\{\omega$-[dimethyl(3-imidopropyl)silyl]alkyl\}dimethyl(3-imidopropyl)ammonium bromides 10, 26-50, rac-51, and rac-52. General method. A solution of one of the ( $\omega$-bromoalkyl)(3-imidopropyl)dimethylsilanes 117-126 or rac-127 and one of the amines 128-131 or rac-132 (in this context, see Charts 3 and 5 and Schemes 15 and 16) in ethanol was heated under reflux for 48 h . After the mixture was cooled to $20^{\circ} \mathrm{C}$, the solvent was removed at 30 mbar , and ethyl acetate $(50 \mathrm{~mL})$ was added. The solution was concentrated in vacuo to a volume of 3 mL per mmol silane by lowering the pressure slowly from 200 mbar to 30 mbar . The addition of ethyl
acetate and subsequent evaporation of the solvent were repeated until the product precipitated almost quantitatively as a white amorphous solid. This product was isolated by centrifugation (1100 $\times \mathrm{g}, 5 \mathrm{~min})$, washed with $n$-pentane $(2 \times 20 \mathrm{~mL})$, and dried in vacuo ( $2 \mathrm{~h}, 0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}$ ) to give the desired (3-imidopropyl) $\{\omega$-[(3-imidopropyl)dimethylsilyl]alkyl $\}$ dimethylammonium bromide as a white amorphous solid. Depending on the solubility of the product prepared, one of the following workup protocols (Protocols A-C) was applied. Protocol A. To purify the crude product, a boiling saturated solution in acetone was concentrated by distillation at atmospheric pressure until the product precipitated significantly (in cases where no precipitation occured in the heat, a minimum amount of solvent of $10 \mathrm{~mL} / \mathrm{g}$ was used; as a rule, the rank order of solubilities of the (3-imidopropyl) $\{\omega$-[(3-imidopropyl)dimethylsilyl]alkyl $\}$ dimethylammonium bromides in acetone was succinimido $>4$-methylphthalimido $>$ phthalimido $\gg 1,8$-naphthalimido, with the amount of boiling acetone required to dissolve 1 g of the respective substance generally ranging from ca. 10 mL to 1 L ). The precipitation was completed by storing the suspension for several days (for the precipiation time and temperature, see the respective preparation protocol). The product was isolated by centrifugation and washed with acetone $(2 \times 20 \mathrm{~mL})$, the purification procedure (i.e., dissolution in boiling acetone, followed by concentration, precipitation, and centrifugation) was repeated twice, and the product was then dried in vacuo ( $0.001 \mathrm{mbar}, 6{ }^{\circ} \mathrm{C}, 8 \mathrm{~h}$ ) to give the desired (3-imidopropyl) $\{\omega$-[(3-imidopropyl)dimethylsilyl]alkyl $\}$ dimethylammonium bromide as an amorphous white solid. Protocol B. The crude product was dissolved in boiling acetone ( 40 mL ), the solvent was removed at 500 mbar until a residual volume of ca. 15 mL was obtained, ethyl acetate ( 40 mL ) was added at $20^{\circ} \mathrm{C}$, and the mixture was concentrated at $20^{\circ} \mathrm{C}$ under reduced pressure until a trace amount of a white precipitate was observed. The mixture was then kept undisturbed at $4^{\circ} \mathrm{C}$ for 1 day, the resulting precipitate was isolated by filtration, washed with ethyl acetate $(2 \times 20 \mathrm{~mL})$, and the purification protocol was repeated twice. The product was finally washed with $n$-pentane ( $2 \times 20 \mathrm{~mL}$ ) and dried in vacuo ( $0.001 \mathrm{mbar}, 6{ }^{\circ} \mathrm{C}, 8 \mathrm{~h}$ ). Protocol $\mathbf{C}$. The crude product was dissolved in boiling acetone ( 80 mL ), the solvent was removed by distillation at atmospheric pressure until a residual volume of ca. 15 mL was obtained, and ethyl acetate ( 10 mL ) was added to the warm mixture directly after removing the heat source. The mixture was cooled to $20^{\circ} \mathrm{C}$ within 1 h (formation of a precipitate), a further portion of ethyl acetate ( 30 mL ) was added, and the resulting mixture was shaken gently and then kept undisturbed at $4{ }^{\circ} \mathrm{C}$ for 1 day. The resulting precipitate was isolated by filtration, and the purification protocol was repeated twice. The product was finally washed with $n$-pentane $(2 \times 20 \mathrm{~mL})$ and dried in vacuo $\left(0.001 \mathrm{mbar}, 60^{\circ} \mathrm{C}, 8\right.$ h).

In some cases, residual acetone was retained in the products prepared according to the Protocols A-C; therefore, additional subsequent crystallization steps from different solvents became necessary. Generally, vapor diffusion of diethyl ether into a solution of the respective (3imidopropyl) $\{\omega$-[(3-imidopropyl)dimethylsilyl]alkyl $\}$ dimethylammonium bromide in dichloromethane, followed by decantation or centrifugation and drying in vacuo ( $0.001 \mathrm{mbar}, 20$ ${ }^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ), gave satisfying results.

Preparation of $\{4-[d i m e t h y l(3-(1,8-n a p h t h a l i m i d o) p r o p y l) s i l y l] b u t y l\} d i m e t h y l[3-(1,8-$ naphthalimido)propyl]ammonium bromide (26). ## Preparation of $\{6$-[dimethyl(3-(1,8-naphthalimido)propyl)silyl]hexyl\}methyl[3-(1,8-

 naphthalimido)propyl]ammonium chloride (53•HCl). A mixture of $\mathbf{1 1 9}(1.60 \mathrm{~g}, 3.47 \mathrm{mmol}), \mathbf{1 3 5}$ ( $930 \mathrm{mg}, 3.47 \mathrm{mmol}$ ), triethylamine ( $3.52 \mathrm{~g}, 34.8 \mathrm{mmol}$ ), and acetonitrile ( 25 mL ) was heated under reflux for 3 days and was then cooled to $20^{\circ} \mathrm{C}$, diluted with ethyl acetate ( 50 mL ), and washed with a 1 M aqueous potassium carbonate solution ( 50 mL ). The organic layer was separated, and the aqueous phase was extracted with ethyl acetate $(2 \times 50 \mathrm{~mL})$. All organic solutions were combined and dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure, and the oily residue was purified by column chromatography on silica gel (column dimensions, $81 \times 3 \mathrm{~cm}$;silica gel (32-63 $\mu \mathrm{m}$, ICN 02826), 250 g ; eluent, ethyl acetate/triethylamine 99:1 (v/v)). The relevant fractions (TLC control) were combined, and the solvent was removed in vacuo ( 0.001 mbar, $20^{\circ} \mathrm{C}, 2$ days) to give 1.4 g of a highly viscous, yellowish oil (compound 53 ). ${ }^{62}$ This product was dissolved in dichloromethane ( 66 mL ), and 1.06 mL of a 2 M ethereal hydrogen chloride solution ( 2.12 mmol of HCl ) were added at $20^{\circ} \mathrm{C}$. The resulting hydrochloride was crystallized by vapor diffusion of diethyl ether into this solution at $20^{\circ} \mathrm{C}$ over a period of ca. 2 weeks, the product was isolated by decantation, redissolved in dichloromethane ( 61 mL ), recrystallized and isolated as described above, and finally dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give $\mathbf{5 3} \cdot \mathrm{HCl}$ in $56 \%$ yield (related to 119 ) as a colorless crystalline solid ( $1.34 \mathrm{~g}, 1.96 \mathrm{mmol}$ ); mp 222-223 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}{ }^{89}\right): \delta-0.04\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.43-0.54\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{~N}^{+}\right), 0.54-0.64(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{N}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 1.21-1.41\left(\mathrm{~m}, 6 \mathrm{H}, \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}^{+}\right), 1.58-1.72\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right)$, $1.72-1.92\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}^{+}\right), 2.18-2.45\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{N}^{+} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}\right), 2.74\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=4.2\right.$ $\left.\mathrm{Hz}, 3 \mathrm{H}, \mathrm{N}^{+} \mathrm{CH}_{3}\right), 2.85-3.31\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{2} \mathrm{~N}^{+}, \mathrm{N}^{+} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}\right), 3.98-4.08(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{NCH}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Si}\right), 4.25\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{N}^{+}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{~N}\right), 7.65-7.76(\mathrm{~m}, 4 \mathrm{H}, \mathrm{H}-3 / \mathrm{H}-6$, Naphth), 8.13-8.22 (m, 4 H, H-4/H-5, Naphth), 8.46-8.53 (m, 4 H, H-2/H-7, Naphth), 12.4 (br s, 1 $\mathrm{H}, \mathrm{N} H) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-3.4\left(\mathrm{SiCH}_{3}\right), 12.8\left(\mathrm{~N}_{\left.\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 15.1\left(\mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{~N}^{+}\right), 22.8}\right.$ $\left(\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), \quad 23.3 \quad\left(\mathrm{~N}^{+} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}\right), \quad 23.6 \quad\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{~N}^{+}\right), \quad 23.9$ $\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{~N}^{+}\right), \quad 26.7 \quad\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}^{+}\right), \quad 33.1 \quad\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{~N}^{+}\right), \quad 37.9$ $\left(\mathrm{N}^{+}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{~N}\right), \quad 39.8 \quad\left(\mathrm{~N}^{+} \mathrm{CH}_{3}\right), \quad 43.5 \quad\left(\mathrm{NCH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Si}\right), \quad 53.7 \quad\left(\mathrm{~N}^{+} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{~N}\right), \quad 56.0$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{2} \mathrm{~N}^{+}\right), 122.5$ ( $\mathrm{C}-1 / \mathrm{C}-8$, Naphth), 123.0 ( $\mathrm{C}-1 / \mathrm{C}-8$, Naphth), 127.19 ( $\mathrm{C}-3 / \mathrm{C}-6$, Naphth), 127.22 ( $C-3 / C-6$, Naphth), 128.27 ( $C-8 \mathrm{a}$, Naphth), 128.28 ( $C-8 \mathrm{a}$, Naphth), 131.1 ( $C-2 / C-7$, Naphth), 131.4 ( $C-2 / C-7$, Naphth), 131.83 ( $C-4 \mathrm{a}$, Naphth), 131.86 ( $C-4 \mathrm{a}$, Naphth), 134.1 ( $C-4 / C-5$, Naphth), 134.5 (C-4/C-5, Naphth), $164.2 \quad\left((\mathrm{O}=C)_{2} \mathrm{~N}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Si}\right)$, $164.4 \quad\left(\mathrm{~N}^{+}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{~N}(\mathrm{C}=\mathrm{O})_{2}\right) .{ }^{15} \mathrm{~N}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-331\left(N^{+}\right),-204\left(N\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Si}\right.$ or $\left.\mathrm{N}^{+}\left(\mathrm{CH}_{2}\right)_{3} N\right),-206\left(N\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Si}\right.$ or $\left.\mathrm{N}^{+}\left(\mathrm{CH}_{2}\right)_{3} N\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta$ 2.9. Preparation of 1,1-dichloro-1-silacyclohexane (55). ${ }^{90} 50 \mathrm{~mL}$ of a solution of 1,5dibromopentane $(161 \mathrm{~g}, 700 \mathrm{mmol})$ in diethyl ether $(300 \mathrm{~mL})$ were added to a stirred suspension of magnesium turnings ( $37.4 \mathrm{~g}, 1.54 \mathrm{~mol}$ ) in diethyl ether ( 400 mL ), and the reaction was started by gentle heating. Subsequently, the remaining 1,5-dibromopentane solution was added within 2 h , causing the mixture to boil under reflux. After the addition was complete, the mixture was heated under reflux for a further 90 min and then cooled to $20^{\circ} \mathrm{C}$ within 1 h . The resulting two-phase Grignard reagent (which was separated from residual magnesium turnings by decantation, followed by washing of the magnesium with diethyl ether $(2 \times 50 \mathrm{~mL})$ ) was added dropwise within 2 h to a solution of tetrachlorosilane $(131 \mathrm{~g}, 771 \mathrm{mmol})$ in diethyl ether $(300 \mathrm{~mL})$, causing the mixture to boil under reflux. During the addition, the mixture was stirred vigorously with a mechanical stirrer (formation of a precipitate). The mixture was stirred at $20^{\circ} \mathrm{C}$ for 16 h , and the precipitate was separated by filtration and washed with diethyl ether $(2 \times 200 \mathrm{~mL})$. The filtrate and the wash solutions were combined, and the solvent was removed by distillation under atmospheric pressure, causing a postprecipitation. The precipitate was separated by decantation and washed with $n$ pentane $(2 \times 50 \mathrm{~mL})$, and the organic solutions were combined. The solvent was removed as described above, and the crude product was isolated by distillation under atmospheric pressure; bp $166-178{ }^{\circ} \mathrm{C}$. Redistillation (Vigreux column, 30 cm ) under reduced pressure afforded 55 in $62 \%$ yield (related to 1,5 -dibromopentane) as a colorless liquid ( $72.9 \mathrm{~g}, 431 \mathrm{mmol}$ ); bp $70-71{ }^{\circ} \mathrm{C} / 37$ mbar. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.13-1.22\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.43-1.52\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 1.77-$ $1.87\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 20.2\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 24.0\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 28.6$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 28.8$. Preparation of 1,1-dimethoxy-1-silacyclohexane (56). Protocol A. ${ }^{90}$ Methanol ( $34.8 \mathrm{~g}, 1.09$ $\mathrm{mol})$ was added dropwise within 10 min to a stirred solution of $55(83.2 \mathrm{~g}, 492 \mathrm{mmol})$ and triethylamine ( $110 \mathrm{~g}, 1.09 \mathrm{~mol}$ ) in $n$-hexane $(500 \mathrm{~mL})$, causing the mixture to boil under reflux (formation of a precipitate). After the addition was complete, the mixture was heated under reflux for a further 2 h and was then cooled to $20^{\circ} \mathrm{C}$ within 1 h and left undisturbed at this temperature for 16 h . The precipitate was separated by suction filtration and washed thoroughly with $n$-hexane ( 1.5
L). The filtrate and the wash solutions were combined, the solvent was removed by distillation under atmospheric pressure (Vigreux column, 20 cm ), and the residue was distilled in vacuo (Vigreux column, 20 cm ) to give 56 as a crude product ( 69 g ; bp $70-75^{\circ} \mathrm{C} / 30 \mathrm{mbar}$ ) that contained small amounts of a solid. The distillate was diluted with $n$-pentane ( 150 mL ), the mixture was kept undisturbed at $4^{\circ} \mathrm{C}$ for 16 h , the resulting precipitate was separated by filtration, the filter cake was washed with $n$-pentane ( 20 mL ), and the filtrate and the wash solution were combined. The solvent was removed by distillation under atmospheric pressure (Vigreux column, 30 cm ), and the residue was distilled in vacuo (Vigreux column, 30 cm ) to give 56 in $80 \%$ yield as a colorless liquid ( 62.8 g, 392 mmol$)$; bp $62{ }^{\circ} \mathrm{C} / 20 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.63-0.72\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.32-1.43(\mathrm{~m}$, $\left.2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 1.62-1.75\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 3.50\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{OCH}_{3}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ $11.0\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 24.6\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.6\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 50.1\left(\mathrm{OCH}_{3}\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-5.1$. Anal. Calcd for $\mathrm{C}_{7} \mathrm{H}_{16} \mathrm{O}_{2} \mathrm{Si}$ : C, 52.45; H, 10.06. Found: C, 52.6; H, 9.9. Protocol B. ${ }^{90}$ A 1,5bis(bromomagnesio)pentane reagent was prepared from magnesium turnings ( $22.0 \mathrm{~g}, 905 \mathrm{mmol}$ ), 1,5-dibromopentane ( $46.0 \mathrm{~g}, 200 \mathrm{mmol}$ ), and diethyl ether ( 200 mL ) analogous to Protocol A (see above). The two-phase Grignard reagent was then added at $0^{\circ} \mathrm{C}$ over a period of 1 h to a vigorously stirred solution of tetramethoxysilane $(45.7 \mathrm{~g}, 300 \mathrm{mmol})$ in diethyl ether $(500 \mathrm{~mL})$ (formation of a precipitate). After the addition was complete, the mixture was heated under reflux for 16 h and was then cooled to $20^{\circ} \mathrm{C}$ within 1 h . The precipitate was separated by filtration and washed with diethyl ether $(3 \times 50 \mathrm{~mL})$, the filtrate and the wash solutions were combined, the solvent was removed under reduced pressure, and the residue was distilled and then redistilled in vacuo to give $\mathbf{5 6}$ in $\mathbf{4 3 \%}$ yield (related to 1,5 -dibromopentane) as a colorless liquid ( $13.9 \mathrm{~g}, 86.7 \mathrm{mmol}$ ); bp $75^{\circ} \mathrm{C} / 36 \mathrm{mbar}$. The NMR data of the product were identical with those obtained for $\mathbf{5 6}$ synthesized according to Protocol A. Anal. Calcd for $\mathrm{C}_{7} \mathrm{H}_{16} \mathrm{O}_{2} \mathrm{Si}$ : C, 52.45 ; H, 10.06. Found: C, 51.7; H, 9.9.

## Preparation of 4-methoxyacetophenone 2,4,6-triisopropylbenzenesulfonylhydrazone

 (57). This compound was synthesized according to ref. 91 and was isolated, after recrystallization from boiling methanol (crystallization at $4{ }^{\circ} \mathrm{C}$ over a period of 16 h ), as a colorless crystalline solid; mp $152-153{ }^{\circ} \mathrm{C}(\mathrm{dec}) .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right) \cdot{ }^{.92} \delta 1.25\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=6.8 \mathrm{~Hz}, 6 \mathrm{H}, p-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 1.30(\mathrm{~d}$, $\left.{ }^{3} J_{\mathrm{HH}}=6.8 \mathrm{~Hz}, 12 \mathrm{H}, o-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 2.16\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{C}(=\mathrm{N}) \mathrm{CH}_{3}\right), 2.92\left(\right.$ septett, ${ }^{3} J_{\mathrm{HH}}=6.8 \mathrm{~Hz}, 1 \mathrm{H}, p-$ $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 3.80\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 4.31\left(\right.$ septett, $\left.{ }^{3} J_{\mathrm{HH}}=6.8 \mathrm{~Hz}, 2 \mathrm{H}, o-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 6.81-6.89(\mathrm{~m}, 2$ H, H-3/H-5, C(=N)-Aryl), 7.22 (s, $2 \mathrm{H}, \mathrm{S}-\mathrm{Aryl}), 7.56-7.64$ (m, $2 \mathrm{H}, H-2 / H-6, \mathrm{C}(=\mathrm{N})$-Aryl), 7.7 (br s, $1 \mathrm{H}, \mathrm{N} H) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 13.3\left(\mathrm{C}(=\mathrm{N}) C H_{3}\right), 23.6\left(p-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 24.9\left(o-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 30.4$ $\left(o-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 34.6\left(p-\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right), 55.6\left(\mathrm{OCH}_{3}\right), 113.9(\mathrm{C}-3 / C-5, \mathrm{C}(=\mathrm{N})$-Aryl), $124.2(\mathrm{C}-3 / \mathrm{C}-5$, $\mathrm{S}-$ Aryl), 128.0 (C-2/C-6, C(=N)-Aryl), 130.2 (C-1, C(=N)-Aryl), 131.9 (C-1, S-Aryl), 151.5$\left(C(=\mathrm{N}) \mathrm{CH}_{3}\right)$, 151.6 (C-2/C-6, S-Aryl), 153.9 (C-4, S-Aryl), 161.2 ( $C-4, \mathrm{C}(=\mathrm{N})$-Aryl). Anal. Calcd for $\mathrm{C}_{24} \mathrm{H}_{34} \mathrm{~N}_{2} \mathrm{O}_{3} \mathrm{~S}: \mathrm{C}, 66.94 ; \mathrm{H}, 7.96 ; \mathrm{N}, 6.51 ; \mathrm{S}, 7.45$. Found: C, 67.0; H, 8.0; N, 6.6; S, 7.6.

Preparation of 1-methoxy-1-[1-(4-methoxyphenyl)vinyl]-1-silacyclohexane (59). A 2.7 M solution of $n$-butyllithium in $n$-heptane ( $70 \mathrm{~mL}, 189 \mathrm{mmol}$ of $n$-BuLi) was added dropwise at $-78{ }^{\circ} \mathrm{C}$ within 50 min to a stirred mixture of finely ground $57(40.0 \mathrm{~g}, 92.9 \mathrm{mmol})$, TMEDA (31.0 $\mathrm{g}, 267 \mathrm{mmol})$, and $n$-hexane ( 360 mL ). The resulting yellow mixture was stirred at $-78^{\circ} \mathrm{C}$ for 2 h and then warmed to $0^{\circ} \mathrm{C}$ within 90 min (evolution of nitrogen; change of color to orange; formation of [1-(4-methoxyphenyl)vinyl]lithium (58)). After the nitrogen evolution was finished, the mixture was stirred at $20^{\circ} \mathrm{C}$ for a further 10 min and then added dropwise at $0^{\circ} \mathrm{C}$ within 30 min to a stirred solution of $\mathbf{5 6}(15.0 \mathrm{~g}, 93.6 \mathrm{mmol})$ in $n$-hexane $(100 \mathrm{~mL})$. The resulting mixture was warmed to 20 ${ }^{\circ} \mathrm{C}$ within 1 h (change of color from orange to yellow within ca. 12 h ) and stirred at this temperature for 3 days. The resulting clear yellow solution was cooled in an ice bath, and iodomethane ( 125 g , 881 mmol ) was added (formation of a precipitate). After a period of 2 h , the ice bath was removed and stirring was continued at $20^{\circ} \mathrm{C}$ for 1 day. The precipitate was separated by filtration and washed with $n$-hexane ( $4 \times 250 \mathrm{~mL}$ ), and the filtrate and the wash solutions were combined. The solvent was removed under reduced pressure, and the residue was distilled in vacuo (Kugelrohr apparatus; first fraction, $\leq 90^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, discarded; second fraction, $90-145{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, crude product). The crude products of three identical runs of this preparation were combined $(\rightarrow$ 43.0 g ) and distilled in vacuo (Vigreux column, 15 cm ) to give 59 in $45 \%$ yield (related to 56) as a colorless oily liquid ( $33.2 \mathrm{~g}, 127 \mathrm{mmol}$ ); bp $105^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.71-0.98$ ( $\mathrm{m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}$ ), 1.34-1.58 (m, $\left.2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 1.62-1.82\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 3.44(\mathrm{~s}, 3$ $\left.\mathrm{H}, \mathrm{SiOCH}_{3}\right), 3.79\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{COCH}_{3}\right), 5.64\left(\delta_{\mathrm{A}}\right)$ and $6.02\left(\delta_{\mathrm{B}}\right)\left(2 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=2.7 \mathrm{~Hz}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right), 6.83-$ 6.90 (m, $2 \mathrm{H}, H-3 / H-5$, Aryl), $7.26-7.33$ (m, $2 \mathrm{H}, H-2 / H-6$, Aryl). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 12.6$ $\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 24.7\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 30.2\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 50.6\left(\mathrm{SiOCH}_{3}\right), 55.5\left(\mathrm{COCH}_{3}\right), 114.0(\mathrm{C}-3 / \mathrm{C}-$ 5, Aryl), $128.00\left(\mathrm{C}=\mathrm{CH}_{2}\right), 128.05\left(C-2 / C-6\right.$, Aryl), 135.9 ( $C-1$, Aryl), $147.8\left(C=\mathrm{CH}_{2}\right), 159.1(C-4$, Aryl). ${ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ : $\delta 3.7$. Anal. Calcd for $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{OSi}: \mathrm{C}, 72.36 ; \mathrm{H}$, 8.67. Found: C, 72.1; H, 8.7.

Preparation of 1-methoxy-1-(2,4,6-trimethoxyphenyl)-1-silacyclohexane (61). A suspension of $1,3,5$-trimethoxybenzene $(50.0 \mathrm{~g}, 297 \mathrm{mmol})$ in a mixture of $n$-hexane ( 175 mL ) and TMEDA ( $35.7 \mathrm{~g}, 307 \mathrm{mmol}$ ) was heated to ca. $50^{\circ} \mathrm{C}$ to dissolve the $1,3,5$-trimethoxybenzene. After the heat source was removed, a 2.5 M solution of $n$-butyllithium in $n$-hexane ( $121 \mathrm{~mL}, 303 \mathrm{mmol}$ of $n-\mathrm{BuLi}$ ) was added dropwise within 30 min to the vigorously stirred mixture. During the addition, the heat of reaction caused the mixture to boil under reflux, and a white precipitate was formed. After the addition was complete, the mixture was stirred vigorously (to prevent agglomeration) at $20^{\circ} \mathrm{C}$ for 3 days (formation of (2,4,6-trimethoxyphenyl)lithium), and the resulting suspension was then added via a dropping funnel at $0^{\circ} \mathrm{C}$ within 20 min to a vigorously stirred solution of 55 ( 50.3 $\mathrm{g}, 297 \mathrm{mmol})$ in $n$-hexane ( 150 mL ). The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 15 min and then at $20^{\circ} \mathrm{C}$ for 6 h , followed by dropwise addition of methanol ( $13.1 \mathrm{~g}, 409 \mathrm{mmol}$ ) within a period of 5 $\min$ (warming to ca. $30-40^{\circ} \mathrm{C}$; formation of a precipitate). The stirred mixture was cooled to $20^{\circ} \mathrm{C}$ within 1 h and then stirred at this temperature for a further 16 h . The resulting suspension was filtered, the filter cake was washed with $n$-hexane $(2 \times 300 \mathrm{~mL})$, and the filtrate and wash solutions were combined. The solvent was removed under reduced pressure, and the liquid residue was distilled in vacuo (Kugelrohr apparatus; first fraction, $\leq 120^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, discarded; second fraction, $120-170^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, crude product ( 65.2 g of a colorless liquid)). The crude product was redistilled in vacuo (Vigreux column, 10 cm ) to give $\mathbf{6 1}$ in $66 \%$ yield as a colorless oily liquid $(58.3 \mathrm{~g}, 197 \mathrm{mmol})$; bp $105{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$. After the liquid was kept at $15-20^{\circ} \mathrm{C}$ for 7 days, it solidified to give a colorless crystalline solid; $\mathrm{mp} 24-25^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.75-0.89,1.08-$ 1.20, 1.23-1.35, 1.53-1.67, and 1.73-1.87 (m, $\left.10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 3.41$ (s, $3 \mathrm{H}, \mathrm{SiOCH}_{3}$ ), 3.73 (s, 6 H , $o-\mathrm{OCH}_{3}$, Tri), 3.81 ( $\mathrm{s}, 3 \mathrm{H}, p-\mathrm{OCH}_{3}$, Tri), 6.07 (s, $2 \mathrm{H}, H-3 / H-5$, Tri). ${ }^{13} \mathrm{C}^{\mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 16.0}$

## Preparation of 1-[1-(4-methoxyphenyl)vinyl]-1-(2,4,6-trimethoxyphenyl)-1-silacyclo-

 hexane (62). A 2.5 M solution of $n$-butyllithium in $n$-hexane ( $75.0 \mathrm{~mL}, 188 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise at $-78{ }^{\circ} \mathrm{C}$ within 20 min to a stirred mixture consisting of finely ground $57(40.0 \mathrm{~g}$, 92.9 mmol ), TMEDA ( $31.0 \mathrm{~g}, 267 \mathrm{mmol}$ ), and $n$-hexane ( 300 mL ). The resulting yellow mixture was stirred at $-78^{\circ} \mathrm{C}$ for 2 h and then warmed to $0{ }^{\circ} \mathrm{C}$ within 90 min (evolution of nitrogen; change of color to orange; formation of [1-(4-methoxyphenyl)vinyl]lithium) (58)). After the nitrogen evolution had finished, the resulting clear solution was stirred at $20^{\circ} \mathrm{C}$ for a further 10 min and then added dropwise at $20^{\circ} \mathrm{C}$ within 25 min to a solution of $61(27.5 \mathrm{~g}, 92.8 \mathrm{mmol})$ in $n$-hexane ( 200 mL ). During the addition, the mixture warmed to ca. $30^{\circ} \mathrm{C}$. The solution was then cooled to $20^{\circ} \mathrm{C}$ and stirred at this temperature for 16 h (change of color from orange to yellow), followed by the addition of silica gel ( $50 \mathrm{~g} ; 32-63 \mu \mathrm{~m}$, ICN 02826 ). The resulting suspension was shaken for 2 min and then subjected to flash chromatography (column diameter, 5.5 cm ; column length, 50 cm ; silica gel, 520 g (32-63 $\mu \mathrm{m}$, ICN 02826); the silica gel that was added before shaking the mixture was allowed to sediment on the top of the column in this step), using petroleum ether $\left(40-65^{\circ} \mathrm{C}\right) /$ diethyl ether/triethylamine (55:40:5 ( $\mathrm{v} / \mathrm{v} / \mathrm{v}$ ) ) as the eluent. The relevant fraction that contained the crude product was concentrated under reduced pressure, the liquid residue was distilled in vacuo (Kugelrohr apparatus; first fraction, $\leq 160{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, discarded; second fraction, 160-220 ${ }^{\circ} \mathrm{C} / 0.001$ mbar, crude product ( 31.3 g of a colorless liquid)), and the crude product was crystallized from $n$-hexane ( 120 mL ; crystallization at $-20^{\circ} \mathrm{C}$ over a period 3 days). The resulting product was isolated by decantation, washed with cold $\left(-20^{\circ} \mathrm{C}\right) n$-pentane ( 10 mL ), recrystallized from $n$ hexane ( 90 mL ; crystallization at $-20^{\circ} \mathrm{C}$ over a period of 4 days), washed with cold $\left(-20^{\circ} \mathrm{C}\right) n$ pentane ( 10 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 2 \mathrm{~h}$ ) to give $\mathbf{6 2}$ in $47 \%$ yield as a colorless crystalline solid ( $17.5 \mathrm{~g}, 43.9 \mathrm{mmol}$ ); $\mathrm{mp} 45-46{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 1.05-1.13,1.26-1.41$, and 1.43-1.78 (m, $\left.10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 3.70\left(\mathrm{~s}, 6 \mathrm{H}, o-\mathrm{OCH}_{3}\right.$, Tri), $3.76\left(\mathrm{~s}, 3 \mathrm{H}, p-\mathrm{OCH}_{3}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, $3.80\left(\mathrm{~s}, 3 \mathrm{H}, p-\mathrm{OCH}_{3}\right.$, Tri), $5.65\left(\delta_{\mathrm{A}}\right)$ and $5.88\left(\delta_{\mathrm{B}}\right)\left({ }^{2} J_{\mathrm{AB}}=3.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}=\mathrm{C} H_{\mathrm{A}} H_{\mathrm{B}}\right), 6.08(\mathrm{~s}, 2 \mathrm{H}, H-$ 3/H-5, Tri), 6.73-6.79 (m, $2 \mathrm{H}, \mathrm{H}-3 / H-5, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}$ ), 7.13-7.19 (m, $2 \mathrm{H}, \mathrm{H}-2 / H-6, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}$ ). ${ }^{13} \mathrm{C}^{\mathrm{NMR}}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 15.0(\mathrm{SiCH} 2 \mathrm{C}), 25.2\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 30.6\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 55.37\left(o-\mathrm{OCH}_{3}\right.$, Tri), $55.44\left(p-\mathrm{OCH}_{3}\right.$, Tri, or $\left.p-\mathrm{OCH}_{3}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 55.5\left(p-\mathrm{OCH}_{3}\right.$, Tri, or $\left.p-\mathrm{OCH}_{3}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, 90.8 (C-3/C-5, Tri), 103.6 ( $C-1$, Tri), $113.5\left(C-3 / C-5, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 126.2\left(\mathrm{C}=\mathrm{CH}_{2}\right)$, $128.1(C-2 / C-6$, $\left.\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, $137.7\left(C-1, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 150.4\left(C=\mathrm{CH}_{2}\right), 158.6\left(C-4, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 164.0(C-4$, Tri) ,167.0 (C-2/C-6, Tri). ${ }^{29}$ Si NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-15.4$. Anal. Calcd for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{O}_{4} \mathrm{Si}: \mathrm{C}, 69.31 ; \mathrm{H}, 7.59$. Found: C, 69.1; H, 7.5.

Preparation of 1-chloro-1-[1-(4-methoxyphenyl)vinyl]-1-silacyclohexane (63). A 2.0 M ethereal hydrogen chloride solution $(11.5 \mathrm{~mL}, 23.0 \mathrm{mmol}$ of HCl$)$ was added to a solution of $\mathbf{6 2}$ $(8.70 \mathrm{~g}, 21.8 \mathrm{mmol})$ in diethyl ether $(30 \mathrm{~mL})$ in one single portion at $0^{\circ} \mathrm{C}$, and the resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 10 min (complete conversion $\mathbf{6 2} \rightarrow \mathbf{6 3}$, GC control). The solvent and the excess hydrogen chloride were removed under reduced pressure at $5-15^{\circ} \mathrm{C}$, the oily residue was dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) and dissolved in $n$-hexane ( 40 mL ), and the resulting solution was then kept undisturbed at $-20{ }^{\circ} \mathrm{C}$ for 2 days (crystallization of 1,3,5trimethoxybenzene). The precipitate was separated by filtration and washed with cold ( $-20^{\circ} \mathrm{C}$ ) $n$ hexane ( 20 mL ), the filtrate and wash solution were combined, and the solvent was removed under reduced pressure at $5-15^{\circ} \mathrm{C}$. The oily residue was distilled in vacuo (Vigreux column, 5 cm ) to give 63 in $77 \%$ yield as a colorless liquid ( $4.46 \mathrm{~g}, 16.7 \mathrm{mmol}$ ); bp $120-122{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.87-1.02,1.05-1.17,1.19-1.34$, and $1.57-1.92\left(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5}\right), 3.79(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{OCH}_{3}\right), 5.73\left(\delta_{\mathrm{A}}\right)$ and $6.00\left(\delta_{\mathrm{B}}\right)\left({ }^{2} J_{\mathrm{AB}}=2.2 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}=\mathrm{C} H_{\mathrm{A}} H_{\mathrm{B}}\right), 6.82-6.89(\mathrm{~m}, 2 \mathrm{H}, H-3 / H-5$, $\left.\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 7.23-7.30\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{H}-2 / \mathrm{H}-6, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right) .{ }^{13} \mathrm{C}^{\mathrm{N}} \mathrm{NR}\left(\mathrm{CDCl}_{3}\right): \delta 15.7\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 23.5$ $\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.2\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 55.2\left(\mathrm{OCH}_{3}\right), 113.8\left(\mathrm{C}-3 / \mathrm{C}-5, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 128.0(\mathrm{C}-2 / \mathrm{C}-6$, $\left.\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, $129.0\left(\mathrm{C}=\mathrm{CH}_{2}\right)$, $134.2\left(C-1, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, $147.1\left(C=\mathrm{CH}_{2}\right)$, $158.9\left(C-4, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$. ${ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 14.7$. Preparation of 1-methoxy-1-[1-(4-methoxyphenyl)vinyl]-1-silacyclopentane (66). A 2.7
M solution of $n$-butyllithium in $n$-heptane ( $70 \mathrm{~mL}, 189 \mathrm{mmol}$ of $n-\mathrm{BuLi}$ ) was added dropwise at -78 ${ }^{\circ} \mathrm{C}$ within 50 min to a stirred mixture of $57(40.0 \mathrm{~g}, 92.9 \mathrm{mmol})$, TMEDA ( $31.0 \mathrm{~g}, 267 \mathrm{mmol}$ ), and $n$-hexane ( 360 mL ). The resulting yellow solution was stirred at $-78^{\circ} \mathrm{C}$ for 2 h and then warmed to $0{ }^{\circ} \mathrm{C}$ within 90 min (evolution of nitrogen; change of color to orange; formation of [1-(4methoxyphenyl)vinyl]lithium (58)). After the nitrogen evolution was finished, the mixture was stirred at $20^{\circ} \mathrm{C}$ for a further 10 min and then added dropwise at $-55 \pm 5^{\circ} \mathrm{C}$ within 30 min to a solution of $\mathbf{6 5}(14.3 \mathrm{~g}, 97.8 \mathrm{mmol})$ in $n$-hexane $(200 \mathrm{~mL})$. The resulting mixture was warmed to -30 ${ }^{\circ} \mathrm{C}$ within 2 h and then to $10^{\circ} \mathrm{C}$ within a further 15 h , and was finally stirred at $20^{\circ} \mathrm{C}$ for 1 day . The resulting clear yellow solution was cooled in an ice bath, and iodomethane ( $125 \mathrm{~g}, 881 \mathrm{mmol}$ ) was added (formation of a precipitate). After a period of 2 h , the ice bath was removed and stirring was continued at $20^{\circ} \mathrm{C}$ for 1 day. The precipitate was separated by filtration and washed with $n$-hexane $(4 \times 250 \mathrm{~mL})$, and the filtrate and the wash solutions were combined. The solvent was removed under reduced pressure, and the residue was distilled in vacuo (Kugelrohr apparatus; first fraction, $\leq$ $90{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, discarded; second fraction, $90-140{ }^{\circ} \mathrm{C} / 0.001$ mbar, crude product ( 15.8 g ) ). Distillation of this crude product in vacuo (Vigreux column, 15 cm ) gave $\mathbf{6 6}$ in $45 \%$ yield (related to $\mathbf{6 5}$ ) as a colorless oily liquid ( $10.9 \mathrm{~g}, 43.9 \mathrm{mmol}$ ); bp $90{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ 0.66-0.89 (m, 4 H, $\mathrm{SiCH}_{2} \mathrm{C}$ ), 1.52-1.79 (m, $4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}$ ), 3.42 ( $\mathrm{s}, 3 \mathrm{H}, \mathrm{SiOCH}_{3}$ ), 3.79 ( $\mathrm{s}, 3 \mathrm{H}$, $\left.\mathrm{COCH}_{3}\right), 5.70\left(\delta_{\mathrm{A}}\right)$ and $6.05\left(\delta_{\mathrm{B}}\right)\left(2 \mathrm{H},{ }^{2} J_{\mathrm{AB}}=2.5 \mathrm{~Hz}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right), 6.83-6.89(\mathrm{~m}, 2 \mathrm{H}, H-3 / H-5$, Aryl), 7.28-7.35 (m, $2 \mathrm{H}, \mathrm{H}-2 / \mathrm{H}-6$, Aryl) ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 10.8\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 26.1\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right)$, $51.0\left(\mathrm{SiOCH}_{3}\right), 55.2\left(\mathrm{COCH}_{3}\right), 113.8\left(C-3 / C-5\right.$, Aryl), $127.4\left(\mathrm{C}=\mathrm{CH}_{2}\right), 127.6(C-2 / C-6$, Aryl), 134.9 ( $C-1$, Aryl), $147.0\left(C=\mathrm{CH}_{2}\right), 158.8\left(C-4\right.$, Aryl). ${ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 26.8$. Anal. Calcd for $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{2}$ Si: C, 67.70; H, 8.12. Found: C, 67.8; H, 8.0.

Preparation of 1-[1-(4-methoxyphenyl)vinyl]-1-silacyclopentane (67). This compound was prepared analogous to the synthesis of $\mathbf{6 0}(\mathbf{6 6}(10.7 \mathrm{~g}, 43.1 \mathrm{mmol})$, LAH ( $820 \mathrm{mg}, 21.6 \mathrm{mmol}$ ), diethyl ether $(100 \mathrm{~mL})$ ) and was isolated in $79 \%$ yield as a colorless oily liquid ( $7.45 \mathrm{~g}, 34.1 \mathrm{mmol}$ ); bp $77{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$. Anal. Calcd for $\mathrm{C}_{9} \mathrm{H}_{20} \mathrm{O}_{2} \mathrm{Si}: \mathrm{C}, 57.40 ; \mathrm{H}, 10.70$. Found: C, 57.1; H, 10.7.

Preparation of 1,1-di-tert-butoxy-1-silacyclobutane (72). This compound was prepared similar to the synthesis of 56, Protocol A ( 69 ( $9.07 \mathrm{~g}, 64.3 \mathrm{mmol}$ ), tert-butanol ( $10.5 \mathrm{~g}, 142 \mathrm{mmol}$ ), triethylamine ( $14.3 \mathrm{~g}, 141 \mathrm{mmol}$ ); reaction time under reflux, 3 h ). After distillation in vacuo (Vigreux column, $5 \mathrm{~cm} ; 9.37 \mathrm{~g}$ of isolated crude product; bp $72-74^{\circ} \mathrm{C} / 5 \mathrm{mbar}$ ) and redistillation in vacuo (Vigreux column, 5 cm ), compound 72 was isolated in $56 \%$ yield as a colorless liquid ( 7.84 $\mathrm{g}, 36.2 \mathrm{mmol})$; bp $73{ }^{\circ} \mathrm{C} / 5 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.30-1.42\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH} \mathrm{C}_{2} \mathrm{C}\right), 1.33(\mathrm{~s}, 18 \mathrm{H}$, $\left.\mathrm{CH}_{3}\right), 1.61-1.74\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 12.1\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 24.3\left(\mathrm{SiCH}_{2} \mathrm{C}\right)$, $31.9\left(\mathrm{CH}_{3}\right)$, $73.4(\mathrm{OC}) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-29.4$. Anal. Calcd for $\mathrm{C}_{11} \mathrm{H}_{24} \mathrm{O}_{2} \mathrm{Si}: \mathrm{C}, 61.06 ; \mathrm{H}$, 11.18. Found: C, 60.9; H, 11.1.

Preparation of 1,1-bis-[1-(4-methoxyphenyl)vinyl]-1-silacyclobutane (73). A 2.7 M solution of $n$-butyllithium in $n$-heptane ( $70 \mathrm{~mL}, 189 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise at -78 ${ }^{\circ} \mathrm{C}$ within 50 min to a stirred mixture of $57(40.0 \mathrm{~g}, 92.9 \mathrm{mmol})$, TMEDA ( $31.0 \mathrm{~g}, 267 \mathrm{mmol}$ ), and $n$-hexane ( 360 mL ). The resulting yellow solution was stirred at $-78^{\circ} \mathrm{C}$ for 2 h and then warmed to $0{ }^{\circ} \mathrm{C}$ within 90 min (evolution of nitrogen; change of color to orange; formation of [1-(4methoxyphenyl)vinyl]lithium (58)). After the nitrogen evolution was finished, the mixture was stirred at $20^{\circ} \mathrm{C}$ for a further 10 min and then added dropwise at $-78^{\circ} \mathrm{C}$ within 70 min to a solution of $70(12.9 \mathrm{~g}, 97.6 \mathrm{mmol})$ in $n$-hexane $(200 \mathrm{~mL})$. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for another 3 h and was then warmed to $20^{\circ} \mathrm{C}$ within 13 h . The resulting mixture was washed with water $(2 \times 200$ mL ), and the organic layer was separated. The first aqueous wash solution (A) was extracted with diethyl ether $(100 \mathrm{~mL})$, the resulting ethereal extract was used to extract the second aqueous wash solution (B), and the organic extract was separated, followed by a second extraction of the wash solutions A and B with $n$-hexane ( 100 mL ), using the same protocol as described for the first extraction sequence. All organic extracts were combined, dried over anhydrous sodium sulfate, and the solvent was removed under reduced pressure. The liquid residue was distilled in vacuo (Kugelrohr apparatus; first fraction, $\leq 150{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, discarded; second fraction, 150-185 ${ }^{\circ} \mathrm{C} / 0.001$ mbar, crude product ( 11.6 g of a colorless liquid)). The crude product was redistilled in vacuo (vigreux column, 5 cm ) to give 73 in $70 \%$ yield (related to 57)/33\% yield (related to 70) as a colorless oily liquid ( $10.9 \mathrm{~g}, 32.4 \mathrm{mmol}$ ); bp. $166-167^{\circ} \mathrm{C} / 0.001 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.32-$ 1.42 (m, $4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}$ ), $2.09-2.22\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right.$ ), $3.78\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 5.73\left(\delta_{\mathrm{A}}\right)$ and 6.06 $\left(\delta_{\mathrm{B}}\right)\left({ }^{2} J_{\mathrm{AB}}=2.5 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right), 6.77-6.83(\mathrm{~m}, 2 \mathrm{H}, H-3 / H-5$, Aryl), $7.17-7.23(\mathrm{~m}, 2 \mathrm{H}, H-$ $2 / \mathrm{H}-6$, Aryl). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 14.5(\mathrm{SiCH} 2 \mathrm{C}), 18.0\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 55.2\left(\mathrm{OCH}_{3}\right), 113.6(C-3 / C-$ 5, Aryl), $127.6\left(\mathrm{C}=\mathrm{CH}_{2}\right), 127.7$ ( $C-2 / C-6$, Aryl), 135.0 ( $C-1$, Aryl), $148.0\left(C=\mathrm{CH}_{2}\right)$, 158.6 ( $C-4$,

Aryl) ${ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 6.3$. Anal. Calcd for $\mathrm{C}_{21} \mathrm{H}_{24} \mathrm{O}_{2} \mathrm{Si}: \mathrm{C}, 74.96 ; \mathrm{H}, 7.19$. Found: C, 74.9; H , 7.2.

Preparation of 1-methoxy-1-(2,4,6-trimethoxyphenyl)-1-silacyclobutane (74). A suspension of $1,3,5$-trimethoxybenzene $(57.2 \mathrm{~g}, 340 \mathrm{mmol})$ in a mixture of $n$-hexane ( 200 mL ) and TMEDA ( $40.0 \mathrm{~g}, 344 \mathrm{mmol}$ ) was heated to ca. $50^{\circ} \mathrm{C}$ to dissolve the $1,3,5$-trimethoxybenzene. After the heat source was removed, a 2.5 M solution of $n$-butyllithium in $n$-hexane ( $138 \mathrm{~mL}, 345 \mathrm{mmol}$ of $n-\mathrm{BuLi})$ was added dropwise within 30 min to the vigorously stirred mixture. During the addition, the heat of reaction caused the mixture to boil under reflux, and a white precipitate was formed. After the addition was complete, the mixture was stirred vigorously (to prevent agglomeration) at $20^{\circ} \mathrm{C}$ for 3 days (formation of (2,4,6-trimethoxyphenyl)lithium), and the resulting suspension was then added via a dropping funnel at $0^{\circ} \mathrm{C}$ within 30 min to a vigorously stirred solution of $\mathbf{6 9}$ (48.0 $\mathrm{g}, 340 \mathrm{mmol})$ in $n$-hexane ( 150 mL ). The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 15 min and then at $20^{\circ} \mathrm{C}$ for 3 h , followed by dropwise addition of methanol ( $12.7 \mathrm{~g}, 396 \mathrm{mmol}$ ) within a period of 5 $\min$ (warming to ca. $30-40^{\circ} \mathrm{C}$; formation of a precipitate). The stirred mixture was cooled to $20^{\circ} \mathrm{C}$ within 1 h and then stirred at this temperature for a further 5 h . The resulting suspension was filtered, the filter cake was washed with $n$-hexane ( 200 mL ) and resuspended in $n$-hexane ( 250 mL ), and the resulting mixture was heated under reflux for 5 min and filtered in the heat. The filter cake was washed again with $n$-hexane ( 100 mL ), and all the filtrates and wash solutions were combined. The solvent was removed under reduced pressure, and the liquid residue was distilled in vacuo (Kugelrohr apparatus; first fraction, $\leq 145{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, discarded; second fraction, 145-165 ${ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, crude product ( 57.1 g of a colorless solid)). The solid distillate was recrystallized from boiling $n$-hexane ( 300 mL ; crystallization at $4^{\circ} \mathrm{C}$ over a period of 16 h ) to give 74 in $58 \%$ yield as a colorless crystalline solid $(53.1 \mathrm{~g}, 198 \mathrm{mmol}) ; \mathrm{mp} 76-77^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 1.31-$ $1.55\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.66-2.00\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CCH}_{2} \mathrm{C}\right), 3.49\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{SiOCH}_{3}\right), 3.75\left(\mathrm{~s}, 6 \mathrm{H}, o-\mathrm{OCH}_{3}\right.$, Tri), $3.82\left(\mathrm{~s}, 3 \mathrm{H}, p-\mathrm{OCH}_{3}\right.$, Tri), $6.09\left(\mathrm{~s}, 2 \mathrm{H}, H-3 / H-5\right.$, Tri) ${ }^{13} \mathrm{C}^{\mathrm{NMR}}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 15.3\left(\mathrm{CCH}_{2} \mathrm{C}\right)$, $20.2\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 51.0\left(\mathrm{SiOCH}_{3}\right), 55.6\left(o-\mathrm{OCH}_{3}\right.$, Tri), $55.8\left(p-\mathrm{OCH}_{3}\right.$, Tri), $90.6(C-3 / C-5$, Tri), 102.7 ( $C-1$, Tri), 164.8 ( $C-4$, Tri), $166.9\left(C-2 / C-6\right.$, Tri). ${ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 7.7$. Anal. Calcd for $\mathrm{C}_{13} \mathrm{H}_{20} \mathrm{O}_{4} \mathrm{Si}: \mathrm{C}, 58.18 ; \mathrm{H}, 7.51$. Found: C, 58.1; H, 7.4.

Preparation of 1-[1-(4-methoxyphenyl)vinyl]-1-(2,4,6-trimethoxyphenyl)-1-silacyclobutane (75). A 2.5 M solution of $n$-butyllithium in $n$-hexane ( $75.0 \mathrm{~mL}, 188 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise at $-78{ }^{\circ} \mathrm{C}$ within 20 min to a stirred mixture consisting of finely ground $57(40.0 \mathrm{~g}$, $92.9 \mathrm{mmol})$, TMEDA ( $31.0 \mathrm{~g}, 267 \mathrm{mmol}$ ), and $n$-hexane ( 300 mL ). The resulting yellow mixture was stirred at $-78^{\circ} \mathrm{C}$ for 2 h and then warmed to $0^{\circ} \mathrm{C}$ within 90 min (evolution of nitrogen; change of color to orange; formation of [1-(4-methoxyphenyl)vinyl]lithium (58)). After the nitrogen
evolution had finished, the resulting clear solution was stirred at $20^{\circ} \mathrm{C}$ for a further 10 min and then added dropwise within 25 min to a gently refluxing ${ }^{94}$ solution of $74(24.9 \mathrm{~g}, 92.8 \mathrm{mmol})$ in $n-$ hexane ( 200 mL ). The solution was then cooled to $20^{\circ} \mathrm{C}$ and stirred at this temperature for 16 h (change of color from orange to yellow), followed by the addition of silica gel ( $50 \mathrm{~g} ; 32-63 \mu \mathrm{~m}$, ICN 02826). The resulting suspension was shaken for 2 min and then subjected to flash chromatography (column diameter, 5.5 cm ; column length, 50 cm ; silica gel, $520 \mathrm{~g}(32-63 \mu \mathrm{~m}$, ICN 02826); the silica gel that was added before shaking the mixture was allowed to sediment on the top of the column in this step), using petroleum ether $\left(40-65^{\circ} \mathrm{C}\right)$ /diethyl ether/triethylamine (55:40:5 $(\mathrm{v} / \mathrm{v} / \mathrm{v}))$ as the eluent. The relevant fraction that contained the crude product was concentrated under reduced pressure, the liquid residue was distilled in vacuo (Kugelrohr apparatus; first fraction, $\leq 180$ ${ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, discarded; second fraction, $180-200{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$, crude product ( 21.9 g of a yellowish oily liquid), and the crude product was crystallized from $n$-hexane ( 145 mL ; crystallization at $4{ }^{\circ} \mathrm{C}$ over a period of 3 days). The resulting product was isolated by decantation, washed with cold ( $4^{\circ} \mathrm{C}$ ) $n$-pentane ( 10 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 2 \mathrm{~h}$ ) to give 75 in $62 \%$ yield as a colorless crystalline solid ( $21.3 \mathrm{~g}, 57.5 \mathrm{mmol}$ ); mp $45-46{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ : $\delta 1.31-1.54\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.92-2.23\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CCH}_{2} \mathrm{C}\right), 3.72\left(\mathrm{~s}, 6 \mathrm{H}, o-\mathrm{OCH} H_{3}\right.$, Tri), $3.77(\mathrm{~s}, 3$ $\left.\mathrm{H}, p-\mathrm{OCH}_{3}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 3.80\left(\mathrm{~s}, 3 \mathrm{H}, p-\mathrm{OCH} H_{3}, \mathrm{Tri}\right), 5.73\left(\delta_{\mathrm{A}}\right)$ and $6.03\left(\delta_{\mathrm{B}}\right)\left({ }^{2} J_{\mathrm{AB}}=2.8 \mathrm{~Hz}, 2 \mathrm{H}\right.$, $\mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}$ ), 6.08 ( $\mathrm{s}, 2 \mathrm{H}, H-3 / H-5$, Tri), 6.77-6.84 (m, $2 \mathrm{H}, H-3 / H-5, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}$ ), 7.31-7.39 (m, 2 H, H-2/H-6, $\left.\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 16.9\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 19.2\left(\mathrm{CCH}_{2} \mathrm{C}\right), 55.5\left(p-\mathrm{OCH} \mathrm{H}_{3}\right.$, Tri, or $\left.p-\mathrm{OCH}_{3}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, $55.6\left(p-\mathrm{OCH}_{3}\right.$, Tri, or $\left.p-\mathrm{OCH}_{3}, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, $55.7\left(o-\mathrm{OCH}_{3}\right.$, Tri), $90.8(C-$ $3 / C-5$, Tri), 103.9 ( $C-1$, Tri), $113.7\left(C-3 / C-5, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 125.4\left(\mathrm{C}=C \mathrm{H}_{2}\right)$, $128.1(C-2 / C-6$, $\left.\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, $135.9\left(\mathrm{C}-1, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right), 149.7\left(C=\mathrm{CH}_{2}\right), 158.9\left(C-4, \mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OCH}_{3}\right)$, 164.4 ( $\mathrm{C}-4$, Tri), 166.3 (C-2/C-6, Tri). ${ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 1.4$. Preparation of 1,1-bis(dimethylamino)-1-silacyclohexane (81). A 2.5 M solution of $n$ butyllithium in $n$-hexane ( $18.0 \mathrm{~mL}, 45.0 \mathrm{mmol}$ of $n-\mathrm{BuLi}$ ) was added dropwise at $-50^{\circ} \mathrm{C}$ within 15 min to a stirred solution of dimethylamine ( $7.12 \mathrm{~g}, 158 \mathrm{mmol}$ ) in THF ( 70 mL ). The resulting mixture was warmed to $-15^{\circ} \mathrm{C}$ within 2 h , followed by dropwise addition of $55(3.73 \mathrm{~g}, 22.1 \mathrm{mmol})$ at $-15^{\circ} \mathrm{C}$ within a period of 25 min . The resulting solution was warmed to $20^{\circ} \mathrm{C}$ within 4 h and then stirred at $20^{\circ} \mathrm{C}$ for a further 12 h . The solvent was removed completely under reduced pressure at $5-15{ }^{\circ} \mathrm{C}$, followed by addition of $n$-hexane ( 100 mL ) (formation of a precipitate). The mixture was stirred at $20^{\circ} \mathrm{C}$ for 1 day, the resulting precipitate was separated by filtration, and the filter
cake was washed with $n$-hexane ( 20 mL ). The filtrate and the wash solution were combined, the solvent was removed completely under reduced pressure at $5-15^{\circ} \mathrm{C}$, and the residue was distilled in vacuo (Vigreux column, 5 cm ) to give $\mathbf{8 1}$ in $75 \%$ yield as a colorless liquid ( $3.07 \mathrm{~g}, 16.5 \mathrm{mmol}$ ); bp $69-70{ }^{\circ} \mathrm{C} / 3 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.61-0.70\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.33-1.44(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 1.57-1.67\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 2.46\left(\mathrm{~s}, 12 \mathrm{H}, \mathrm{NCH} 3\right.$ ). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta$ $11.7\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 25.1\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 30.7\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 37.8\left(\mathrm{NCH}_{3}\right) .{ }^{29} \mathrm{Si} \operatorname{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta$ -6.0. Anal. Calcd for $\mathrm{C}_{9} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{Si}$ : C, $58.00 ; \mathrm{H}, 11.90$; N, 15.03. Found: C, 57.9; H, 12.0; N, 15.1.

Dimethyl-(2-phenylethyl)amine (82). This compound was commercially available (Aldrich, 52,380-1).

1,2-Bis(chlorodimethylsilyl)ethane (83). This compound was a gift from the WackerChemie GmbH, Burghausen, Germany. ${ }^{96}$

Preparation of 1,2-bis(ethynyldimethylsilyl)ethane (84).
Protocol A. This compound was synthesized according to ref. 97.
Protocol B. A mixture of $\mathbf{8 3}(121 \mathrm{~g}, 562 \mathrm{mmol})$, sodium acetylide ( 300 g of an $18 \%$ suspension of $\mathrm{NaC} \equiv \mathrm{CH}$ in xylene (mixture of isomers), 1.12 mol of $\mathrm{NaC} \equiv \mathrm{CH}$ ), and THF (THF) $(360 \mathrm{~mL})$ was heated under reflux for 3 h . The mixture was cooled to $20^{\circ} \mathrm{C}$ and washed with water $(2 \times 450 \mathrm{~mL})$, and the organic layer was separated. The first aqueous wash solution (A) was extracted with diethyl ether $(300 \mathrm{~mL})$, the resulting ethereal extract was used to extract the second aqueous wash solution (B), and the organic extract was separated, followed by a second extraction of the wash solutions A and B with a fresh portion of diethyl ether ( 300 mL ), using the same protocol as described for the first extraction sequence. All organic extracts were combined and dried over anhydrous sodium sulfate, most of the solvent was removed under reduced pressure, and the remaining xylene was then removed by vacuum distillation $\left(30-50^{\circ} \mathrm{C} / 15 \mathrm{mbar}\right)$ using a Vigreux column $(40 \mathrm{~cm})$. The residues from four identical runs of this preparation were combined and distilled in vacuo (Vigreux column, 40 cm ) to give 245 g of pure ( GC control) $\mathbf{8 4}\left(75-77^{\circ} \mathrm{C} / 20\right.$ mbar) and 126 g of a lower-boiling fraction containing 84 and xylene ( $50-75^{\circ} \mathrm{C} / 20 \mathrm{mbar}$ ). The latter fraction was redistilled (Vigreux column, 80 cm ) to give a further 65 g of $\mathbf{8 4}\left(75-77{ }^{\circ} \mathrm{C} / 20\right.$ mbar). Compound $\mathbf{8 4}$ was obtained in a total yield of $71 \%$ as a colorless liquid ( $310 \mathrm{~g}, 1.59 \mathrm{~mol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.16\left(\mathrm{~s}, 12 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.60(\mathrm{~s}, 4 \mathrm{H}, \mathrm{SiCH} \mathrm{C}), 2.36(\mathrm{~s}, 2 \mathrm{H}, \mathrm{SiC} \equiv \mathrm{CH}) .{ }^{13} \mathrm{C}$ NMR
 -12.8. Anal. Calcd for $\mathrm{C}_{10} \mathrm{H}_{18} \mathrm{Si}_{2}$ : C, 61.78; H, 9.33. Found: C, 61.6; H, 9.2.

Methyl 4-formylbenzoate (85). This compound was commercially available (Fluka, 47717).
Preparation of methyl 4-[1-(trimethylsilyloxy)but-2-ynyl]benzoate (86). A 0.5 M solution of 1-propynylmagnesium bromide in THF ( $422 \mathrm{~mL}, 211 \mathrm{mmol}$ of $\mathrm{MeC} \equiv \mathrm{CMgBr}$ ) was added
dropwise at $-20^{\circ} \mathrm{C}$ to $-15^{\circ} \mathrm{C}$ within 105 min to a stirred solution of $\mathbf{8 5}(34.6 \mathrm{~g}, 211 \mathrm{mmol})$ in THF $(250 \mathrm{~mL})$, and the mixture was then warmed to $-10{ }^{\circ} \mathrm{C}$ within 2 h . Subsequently, chlorotrimethylsilane ( $27.5 \mathrm{~g}, 253 \mathrm{mmol}$ ) was added dropwise at $-10^{\circ} \mathrm{C}$ over a period of 30 min , and the mixture was warmed to $15^{\circ} \mathrm{C}$ within 15 h . Most of the solvent was removed under reduced pressure at $5-15{ }^{\circ} \mathrm{C}$, followed by addition of $n$-hexane $(500 \mathrm{~mL})$. The resulting precipitate was separated by filtration and washed with $n$-hexane $(2 \times 250 \mathrm{~mL})$, and the organic solutions were combined. The solvent was removed under reduced pressure at $5-15{ }^{\circ} \mathrm{C}$, and the residue was distilled in vacuo to give 86 in $61 \%$ yield as a colorless liquid ( $35.3 \mathrm{~g}, 128 \mathrm{mmol}$ ); bp 113 ${ }^{\circ} \mathrm{C} / 0.0005 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.20\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{SiCH}_{3}\right), 1.87\left(\mathrm{~d},{ }^{5} J_{\mathrm{HH}}=2.2 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CCH}_{3}\right)$, $3.89\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{C}(\mathrm{O}) \mathrm{OCH}_{3}\right), 5.49\left(\mathrm{q},{ }^{5} J_{\mathrm{HH}}=2.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{SiOCH}\right), 7.52-7.59(\mathrm{~m}, 2 \mathrm{H}, H-3 / H-5$, Phe'),
 $64.7(\mathrm{SiOCH}), 79.6(C \equiv \mathrm{C}), 83.1(\mathrm{C} \equiv C), 126.6$ ( $C-3 / C-5$, Phe'), 129.9 ( $C-2 / C-6$, Phe'), 130.0 ( $C-1$, Phe'), $147.6\left(C-4\right.$, Phe'), $167.0\left(C(\mathrm{O}) \mathrm{OCH}_{3}\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 20.5$. Anal. Calcd for $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}_{3} \mathrm{Si}: \mathrm{C}, 65.18 ; \mathrm{H}, 7.29$. Found: C, 64.9; H, 7.2.

Preparation of methyl 4-[hydroxy-(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2naphthyl)methyl]benzoate (87). A solution of cyclopentadienylcobaltdicarbonyl $\left(\mathrm{CpCo}(\mathrm{CO})_{2}\right.$; $13.9 \mathrm{~g}, 77.2 \mathrm{mmol})$ in $m$-xylene ( 100 mL ) was added dropwise within 16 h to a stirred boiling solution of $\mathbf{8 4}(149 \mathrm{~g}, 766 \mathrm{mmol})$ and $\mathbf{8 6}(212 \mathrm{~g}, 767 \mathrm{mmol})$ in $m$-xylene ( 1 L ), followed (i) by addition of $\mathbf{8 4}(74.6 \mathrm{~g}, 384 \mathrm{mmol})$ in one single portion at $20^{\circ} \mathrm{C}$, (ii) then by dropwise addition of a solution of $\mathrm{CpCo}(\mathrm{CO})_{2}(14.0 \mathrm{~g}, 77.8 \mathrm{mmol})$ in $m$-xylene $(100 \mathrm{~mL})$ within 11 h at reflux temperature, (iii) then by addition of $\mathbf{8 4}(74.5 \mathrm{~g}, 383 \mathrm{mmol})$ in one single portion at $20^{\circ} \mathrm{C}$, and (iv) finally by dropwise addition of a solution of $\mathrm{CpCo}(\mathrm{CO})_{2}(14.0 \mathrm{~g}, 77.8 \mathrm{mmol})$ in $m$-xylene $(100 \mathrm{~mL})$ within 11 h at reflux temperature. ( To avoid heating of the $\mathrm{CpCo}(\mathrm{CO})_{2}$ solution before its addition, the dropping funnel containing this catalyst was separated from the refluxing reaction mixture by a glass tube (length, 20 cm ), through which the $\mathrm{CpCo}(\mathrm{CO})_{2}$ solution was allowed to drop freely into the refluxing mixture.) 1 L of the solvent was removed by distillation at atmospheric pressure, methanol ( 1 L ) and acetic acid ( $2.31 \mathrm{~g}, 38.5 \mathrm{mmol}$ ) were added, and the mixture was heated under reflux for 8 days. The mixture was cooled to $20^{\circ} \mathrm{C}$ and then diluted with diethyl ether ( 1.5 L ) and washed with a saturated aqueous sodium hydrogen carbonate solution (4 L). The organic layer was separated, the aqueous phase was extracted with diethyl ether ( $3 \times 1 \mathrm{~L}$ ), the organic solutions were combined and dried over anhydrous sodium sulfate, and the solvent was removed under reduced pressure. The black tarry residue ( 982 g ) was diluted with $n$-hexane/ethyl acetate (83:17 (v/v)) (1 L), followed by treatment with ultrasound at $20^{\circ} \mathrm{C}$ for 1 h . The resulting mixture was divided into two equal portions, and each portion was purified by column chromatography on silica gel (column
dimensions, $60 \times 5 \mathrm{~cm}$; silica gel (32-63 $\mu \mathrm{m}$, ICN 02826 ), 600 g ). The impurities (GC control) were eluted with $n$-hexane/ethyl acetate $(83: 17(\mathrm{v} / \mathrm{v}))$, and the product was eluted with $n$ hexane/ethyl acetate (80:20 ( $\mathrm{v} / \mathrm{v}$ )). The relevant fractions (GC control) of both chromatographic separations were combined, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $10 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give 125 g of a brown solid, which was recrystallized twice from boiling $n$-heptane ( 6.25 L were used for each crystallization step; crystallization at $4^{\circ} \mathrm{C}$ over a period of 1 day). The crystalline product was isolated by suction filtration, washed with cold $\left(4^{\circ} \mathrm{C}\right)$ $n$-heptane ( 600 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 54.2 g of 87 . The mother liquors, the wash solution, and the impure fractions ( GC control) obtained from the chromatographic workup were combined, and the resulting solution was concentrated under reduced pressure and then dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give 112 g of a brown solid, which was purified by chromatography as described above. The resulting product ( 54.6 g ) was recrystallized twice from $n$-heptane ( 2.73 L were used for each crystallization step) to give a further 12.4 g of 87 . Compound $\mathbf{8 7}$ was obtained in a total yield of $22 \%$ (related to 86 ) as a colorless crystalline solid ( $66.6 \mathrm{~g}, 167 \mathrm{mmol}$ ); mp $166{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.17\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{SiCH} \mathrm{H}_{3}\right), 0.22(\mathrm{~s}$, $9 \mathrm{H}, \mathrm{SiCH}_{3}$ ), $1.01\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 2.24\left(\mathrm{br} \mathrm{s}, 3 \mathrm{H}, \mathrm{CCH}_{3}\right), 2.45\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=3.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{OH}\right), 3.87$ (s, $3 \mathrm{H}, \mathrm{C}(\mathrm{O}) \mathrm{OCH}_{3}$ ), $6.04\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=3.8 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{OCH}\right.$ ), 7.27 (br s, $\left.1 \mathrm{H}, H-4, \mathrm{Naph}\right), 7.40-7.47(\mathrm{~m}$, 2 H, H-3/H-5, Phe'), 7.56 (br s, 1 H, $H-1$, Naph), $7.94-8.01$ (m, $2 H, H-2 / H-6$, Phe'). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-1.53\left(\mathrm{SiCH}_{3}\right),-1.46(2 \mathrm{C}, \mathrm{SiCH} 3),-1.41\left(\mathrm{SiCH}_{3}\right), 7.78\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 7.83\left(\mathrm{SiCH} \mathrm{H}_{2} \mathrm{C}\right), 19.5$ $\left(\mathrm{CCH}_{3}\right), 52.3\left(\mathrm{C}(\mathrm{O}) \mathrm{OCH}_{3}\right), 73.7(\mathrm{OCH}), 127.1(\mathrm{C}-3 / C-5$, Phe'), $129.6(\mathrm{C}-1$, Phe'), $129.9(C-2 / C-6$, Phe'), 131.8 ( $C$-1, Naph), 135.7 ( $C$-3, Naph), 136.3 (C-4, Naph), 141.3 ( $C$-2, Naph), 143.7 ( $C$-4a or $C-8 \mathrm{a}, \mathrm{Naph}$ ), 145.8 ( $C$-4a or $C-8 \mathrm{a}$, Naph), 148.6 ( $C-4$, Phe'), $167.1\left(C(\mathrm{O}) \mathrm{OCH}_{3}\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-7.05,-6.95$. Anal. Calcd for $\mathrm{C}_{22} \mathrm{H}_{30} \mathrm{O}_{3} \mathrm{Si}_{2}: \mathrm{C}, 66.28 ; \mathrm{H}, 7.59$. Found: $\mathrm{C}, 66.2 ; \mathrm{H}, 7.6$.

## Preparation of methyl 4-[(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-

 naphthyl)carbonyl]benzoate (88). A solution of dimethyl sulfoxide ( $13.6 \mathrm{~g}, 174 \mathrm{mmol}$ ) in dichloromethane $(55 \mathrm{~mL})$ was added dropwise at $-55^{\circ} \mathrm{C}\left( \pm 5^{\circ} \mathrm{C}\right)$ within 60 min to a stirred solution of oxalyl chloride ( $11.0 \mathrm{~g}, 86.7 \mathrm{mmol}$ ) in dichloromethane ( 185 mL ) (gas evolution), and the mixture was stirred for 15 min . Subsequently, a solution of $87(31.5 \mathrm{~g}, 79.0 \mathrm{mmol})$ in dichloromethane ( 100 mL ) was added dropwise at $-55^{\circ} \mathrm{C}\left( \pm 5^{\circ} \mathrm{C}\right)$ within 75 min , the mixture was stirred for 30 min , and triethylamine ( $40.0 \mathrm{~g}, 395 \mathrm{mmol}$ ) was added dropwise at the same temperature over a period of 30 min . (To avoid cooling of the solution of $\mathbf{8 7}$ before its addition, which would result in crystallization of 87 and incomplete conversion, the dropping funnel containing this solution was separated from the cold reaction mixture by a glass tube (length, 20 cm ), through which the solution was allowed to drop freely into the cold mixture). The mixture wasstirred at $-55^{\circ} \mathrm{C}$ for a further 15 min and then warmed to $5{ }^{\circ} \mathrm{C}$ within $90 \mathrm{~min}(>97 \%$ conversion, GC control). The mixture was washed with water $(2 \times 400 \mathrm{~mL})$, the organic phase was separated, the first aqueous wash solution (A) was extracted with diethyl ether ( 500 mL ), the resulting ethereal extract was used to extract the second aqueous wash solution (B), and the organic extract was separated, followed by a second extraction of the wash solutions A and B with a fresh portion of diethyl ether ( 500 mL ), using the same protocol as described for the first extraction sequence. The combined organic solutions were dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $10 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give a brown amorphous solid ( 30.3 g ), which was purified by column chromatography on silica gel (column dimensions, $71 \times 4 \mathrm{~cm}$; silica gel (32-63 $\mu \mathrm{m}$, ICN 02826 ), 480 g ; eluent, $n$-hexane/ethyl acetate (87:13 (v/v)) to afford 7 as an amorphous colorless solid. The product was crystallized from boiling $n$-heptane ( 815 mL ; crystallization at $-20^{\circ} \mathrm{C}$ over a period of 2 days), isolated by suction filtration, washed with cold $\left(-20^{\circ} \mathrm{C}\right) n$-pentane ( 200 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give 25.6 g of $\mathbf{8 8}$. The mother liquor and the wash solution were combined, the resulting solution was concentrated under reduced pressure to a volume of 180 mL , and a further 1.7 g of the product were obtained by crystallization using the same method as described above. Compound $\mathbf{8 8}$ was obtained in a total yield of $87 \%$ as a colorless crystalline solid ( $27.3 \mathrm{~g}, 68.8 \mathrm{mmol}$ ); mp $118{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.17\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.28\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 1.05\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{SiCH} \mathrm{C}_{2} \mathrm{C}\right), 2.30-2.32(\mathrm{~m}, 3 \mathrm{H}$, $\mathrm{CCH}_{3}$ ), 3.93 (s, $3 \mathrm{H}, \mathrm{C}(\mathrm{O}) \mathrm{OCH}_{3}$ ), 7.40 (s, $1 \mathrm{H}, H-1$, Naph), $7.43-7.46$ (m, $1 \mathrm{H}, H-4$, Naph), $7.81-$ 7.88 (m, $2 \mathrm{H}, H-3 / H-5$, Phe'), $8.08-8.15$ (m, $2 \mathrm{H}, H-2 / H-6$, Phe') ${ }^{13} \mathrm{C}^{\mathrm{N} M R}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-1.63(2 \mathrm{C}$, $\mathrm{SiCH} 3),-1.59(2 \mathrm{C}, \mathrm{SiCH} 3), 7.65\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 7.68\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 20.2\left(\mathrm{CCH}_{3}\right), 52.7\left(\mathrm{C}(\mathrm{O}) \mathrm{OCH}_{3}\right), 129.8$ (C-2/C-6, Phe'), 130.3 ( $C-3 / C-5$, Phe'), 133.7 ( $C-1$, Naph), 134.2 ( $C-1$, Phe'), 136.46 ( $C-3$, Naph), 136.49 (C-4, Naph), 137.9 (C-2, Naph), 141.7 (C-4, Phe'), 142.8 (C-4a, Naph), 149.8 (C-8a, Naph), $166.5\left(C(\mathrm{O}) \mathrm{OCH}_{3}\right), 198.3\left(\mathrm{C}_{2} \mathrm{C}=\mathrm{O}\right) .{ }^{29} \mathrm{Si} \mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-6.48,-6.42$. Anal. Calcd for $\mathrm{C}_{22} \mathrm{H}_{28} \mathrm{O}_{3} \mathrm{Si}_{2}$ : C, 66.62; H, 7.12. Found: C, 66.5; H, 7.0.

Preparation of methyl 4-[1-(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2naphthyl)vinyl]benzoate (89). A 0.5 M solution of potassium bis(trimethylsilyl)amide in toluene ( $29.7 \mathrm{~mL}, 14.9 \mathrm{mmol}$ of $\mathrm{KN}\left(\mathrm{SiMe}_{3}\right)_{2}$ ) was added dropwise at $20{ }^{\circ} \mathrm{C}$ within 25 min to a stirred suspension of methyltriphenylphosphonium bromide ( $5.31 \mathrm{~g}, 14.9 \mathrm{mmol}$ ) in toluene ( 55 mL ). The mixture was stirred at $20^{\circ} \mathrm{C}$ for 45 min (initially, dissolution of $\left[\mathrm{Ph}_{3} \mathrm{PMe}\right] \mathrm{Br}$; later, formation of a precipitate) and then added dropwise at $20^{\circ} \mathrm{C}$ within 30 min to a solution of $\mathbf{8 8}(5.61 \mathrm{~g}, 14.1 \mathrm{mmol})$ in toluene $(85 \mathrm{~mL})$. The resulting mixture was stirred at $20^{\circ} \mathrm{C}$ for a further 45 min and then added to a stirred mixture of a saturated aqueous ammonium chloride solution ( 200 mL ) (= solution A) and diethyl ether $(150 \mathrm{~mL})$, and the organic phase was separated and washed with water ( 200 mL )
(= solution B). The first aqueous wash solution A was extracted with diethyl ether ( 150 mL ), the resulting ethereal extract was used to extract the second aqueous wash solution B , and the organic extract was separated, followed by a second extraction of the wash solutions A and B with a fresh portion of diethyl ether ( 150 mL ), using the same protocol as described for the first extraction sequence. All organic extracts were combined and dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure at $5-15^{\circ} \mathrm{C}$, and the solid colorless residue was dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 20 \mathrm{~min}$ ). The crude product ( 11.1 g ) was suspended in $n$-hexane/diethyl ether $(70: 30(\mathrm{v} / \mathrm{v}))(20 \mathrm{~mL})$ and treated with ultrasound at $20^{\circ} \mathrm{C}$ for 30 min (dissolution of $\mathbf{8 9}$ out of the nearly insoluble triphenylphosphine oxide). The resulting suspension was filtered over silica gel (32-63 $\mu \mathrm{m}$, ICN 02826 ; column dimensions, $23 \times 4 \mathrm{~cm}$ ), which was washed with $n$-hexane/diethyl ether $(70: 30(\mathrm{v} / \mathrm{v}))(1 \mathrm{~L})$. The filtrate and wash solution were combined (no residual $\mathrm{Ph}_{3} \mathrm{PO}$ detected by GC), the solvent was removed under reduced pressure, and the residue was dried in vacuo ( 0.001 mbar, $\left.20^{\circ} \mathrm{C}, 1 \mathrm{~h}\right)$ to give a white amorphous solid $(5.54 \mathrm{~g})$, which was then crystallized from boiling $n$-hexane ( 165 mL ; crystallization at $-20^{\circ} \mathrm{C}$ over a period of 3 days) to give $\mathbf{8 9}$ in $90 \%$ yield as a colorless crystalline solid $(5.00 \mathrm{~g}, 12.7 \mathrm{mmol}) ; \mathrm{mp} 130{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 0.22(\mathrm{~s}, 6 \mathrm{H}$, $\mathrm{SiCH}_{3}$ ), $0.25\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 1.04\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.98-2.00\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{CCH}_{3}\right), 3.88(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{C}(\mathrm{O}) \mathrm{OCH}_{3}\right), 5.31\left(\mathrm{~d},{ }^{2} J_{\mathrm{HH}}=1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}=\mathrm{C}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 5.87\left(\mathrm{~d},{ }^{2} J_{\mathrm{HH}}=1.2 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right)$, 7.30-7.38 (m, 4 H, H-3/H-5, Phe', H-1/H-4, Naph), 7.92-7.97 (m, 2 H, $H-2 / H-6$, Phe'). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-1.42(2 \mathrm{C}, \mathrm{SiCH} 3),-1.40\left(2 \mathrm{C}, \mathrm{SiCH} \mathrm{H}_{3}\right), 7.86\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 7.89\left(\mathrm{SiCH} \mathrm{H}_{2} \mathrm{C}\right), 20.2\left(\mathrm{CCH}_{3}\right)$, $52.3\left(\mathrm{C}(\mathrm{O}) \mathrm{OCH}_{3}\right), 117.2\left(\mathrm{C}=\mathrm{CH}_{2}\right), 126.8(C-3 / C-5$, Phe'), $129.6(C-1$, Phe' $), 129.9(C-2 / C-6$, Phe'),

Anal. Calcd for $\mathrm{C}_{23} \mathrm{H}_{30} \mathrm{O}_{2} \mathrm{Si}_{2}$ : C, 70.00; H, 7.66. Found: C, 70.0; H, 7.6.

Preparation of 2-(chloromethyl)furan (90). This compound was synthesized according to ref. 56.

Preparation of 2-(but-2-ynyl)furan (91) and 5-methyl-2-prop-1-ynylfuran (92). A 0.5 M solution of 1-propynylmagnesium bromide in THF ( $746 \mathrm{~mL}, 373 \mathrm{mmol}$ of $\mathrm{MeC} \equiv \mathrm{CMgBr}$ ) was added dropwise at $0^{\circ} \mathrm{C}$ within 2 h to a stirred solution of $90(41.0 \mathrm{~g}, 352 \mathrm{mmol})$ in THF ( 175 mL ), and the mixture was then warmed to $20^{\circ} \mathrm{C}$ within 30 min , followed by heating under reflux for 2 h (quantitative conversion, GC control). The mixture was cooled to $20^{\circ} \mathrm{C}$, diluted with diethyl ether $(350 \mathrm{~mL})$, and washed with a saturated aqueous ammonium chloride solution $(700 \mathrm{~mL})(=$ solution A) and water $(700 \mathrm{~mL})$ (= solution B). The first aqueous wash solution A was extracted with ethyl acetate ( 350 mL ), the resulting organic extract was used to extract the second aqueous wash solution B , and the organic extract was separated, followed by a second extraction of the wash
solutions A and B with a fresh portion of ethyl acetate ( 350 mL ), using the same protocol as described for the first extraction sequence. All organic extracts were combined and dried over anhydrous sodium sulfate, the solvent was removed by distillation at atmospheric pressure (maximum bath temperature $100^{\circ} \mathrm{C}$ ), and the residue was distilled in vacuo (Vigreux column, 10 cm ) to give 25 g of crude product, bp $38-50^{\circ} \mathrm{C} / 2 \mathrm{mbar}$, which was redistilled (spinning band column) to give $\mathbf{9 1}$ and $\mathbf{9 2}$ as colorless liquids; $\mathbf{9 1}, 29 \%$ yield ( $12.2 \mathrm{~g}, 102 \mathrm{mmol}$ ), bp $53^{\circ} \mathrm{C} / 9 \mathrm{mbar}$; 92, $10 \%$ yield ( $4.15 \mathrm{~g}, 34.5 \mathrm{mmol}$ ), bp $60^{\circ} \mathrm{C} / 9 \mathrm{mbar}$.

Data for 91. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.81\left(\mathrm{t},{ }^{5} J_{\mathrm{HH}}=2.6 \mathrm{~Hz}, 3 \mathrm{H}, \mathrm{CCH}_{3}\right), 3.49-3.53(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{CCH}_{2} \mathrm{C}$ ), 6.13-6.17 (m, $\left.1 \mathrm{H}, \mathrm{H}-3, \mathrm{Fu}\right), 6.27-6.30(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-4, \mathrm{Fu}), 7.29-7.32(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-5, \mathrm{Fu})$. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 3.5\left(\mathrm{CCH}_{3}\right), 18.6\left(\mathrm{CCH}_{2} \mathrm{C}\right), 73.8(\mathrm{C} \equiv C), 77.2(\mathrm{C} \equiv \mathrm{C}), 105.8(\mathrm{C}-3, \mathrm{Fu}), 110.3$ (C-4, Fu), $141.5(C-5, \mathrm{Fu}), 151.1(C-2, \mathrm{Fu})$. Anal. Calcd for $\mathrm{C}_{8} \mathrm{H}_{8} \mathrm{O}: \mathrm{C}, 79.97$; H, 6.71. Found: C, 79.6; H, 7.2.

Data for 92. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 2.03\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{C} \equiv \mathrm{CCH}_{3}\right), 2.23-2.25\left(\mathrm{~m}, 3 \mathrm{H}\right.$, Aryl- $\left.\mathrm{CH}_{3}\right)$, 5.87-5.90 (m, $1 \mathrm{H}, \mathrm{H}-4, \mathrm{Fu}), 6.30-6.33(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-3, \mathrm{Fu}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 4.3\left(\mathrm{C} \equiv \mathrm{CCH}_{3}\right)$, $13.6\left(\operatorname{Aryl}-\mathrm{CH}_{3}\right), 70.4\left(\mathrm{C} \equiv \mathrm{CCH}_{3}\right), 89.7\left(\mathrm{C} \equiv \mathrm{CCH}_{3}\right), 106.5(\mathrm{C}-4, \mathrm{Fu}), 114.6(\mathrm{C}-3, \mathrm{Fu}), 135.7(\mathrm{C}-2$, Fu ), 152.6 ( $\mathrm{C}-5, \mathrm{Fu}$ ). Preparation of 2-[(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methylffuran (93). A solution of cyclopentadienylcobaltdicarbonyl $\left(\mathrm{CpCo}(\mathrm{CO})_{2} ; 383 \mathrm{mg}, 2.13\right.$ mmol ) in $m$-xylene ( 115 mL ) was added dropwise within 2 h to a stirred boiling solution of $\mathbf{8 4}$ (6.19 $\mathrm{g}, 31.8 \mathrm{mmol})$, $91(6.89 \mathrm{~g}, 57.3 \mathrm{mmol})$, and $\mathrm{CpCo}(\mathrm{CO})_{2}(383 \mathrm{mg}, 2.13 \mathrm{mmol})$ in $m$-xylene ( 65 mL ), followed (i) by heating under reflux for 3 h , (ii) then by addition of $\mathrm{CpCo}(\mathrm{CO})_{2}$ ( $383 \mathrm{mg}, 2.13$ mmol ) in one single portion, and (iii) finally by heating under reflux for 16 h (complete conversion, GC control). (To avoid heating of the $\mathrm{CpCo}(\mathrm{CO})_{2}$ solution before its addition, the dropping funnel containing this catalyst was separated from the refluxing reaction mixture by a glass tube (length, 20 cm ), through which the $\mathrm{CpCo}(\mathrm{CO})_{2}$ solution was allowed to drop freely into the refluxing mixture.) The mixture was cooled to $20^{\circ} \mathrm{C}$ and filtered over silica gel using a standard chromatographic column (column dimensions, $20 \times 3.5 \mathrm{~cm}$; silica gel ( $32-63 \mu \mathrm{~m}$, ICN 02826) ). The silica gel was washed with diethyl ether ( 500 mL ), the filtrate and the wash solution were combined, and the solvent was removed under reduced pressure. The residue ( 13 g of a yellow oil) was purified by column chromatography on silica gel (column dimensions, $50 \times 3.5 \mathrm{~cm}$; silica gel (15-40 $\mu \mathrm{m}$, Merck 1.15111); eluent, $n$-hexane). The relevant fractions (TLC control) were combined, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $0.001 \mathrm{mbar}, 2{ }^{\circ} \mathrm{C}, 6 \mathrm{~h}$ ) to give $\mathbf{9 3}$ in $41 \%$ yield (related to $\mathbf{8 4}$ ) (including workup of impure fractions using the same chromatographic methods) as a colorless oil ( $4.14 \mathrm{~g}, 13.2 \mathrm{mmol}$ ), which
was pure by NMR and GC. ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 0.36\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.37\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 1.14$ ("s", $4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}$ ), 2.24 (br "s", 3 H, Aryl- $\mathrm{CH}_{3}$ ), 3.91 (br "s", $2 \mathrm{H}, \mathrm{CCH} \mathrm{C}_{2}$ ), $5.85-5.89$ (m, $1 \mathrm{H}, H-3$, Fu), 6.13-6.16 (m, 1 H, H-4, Fu), 7.17-7.19 (m, 1 H, H-5, Fu), 7.46 (br "s", 1 H, H-4, Naph), 7.50 (br "s", $1 \mathrm{H}, H-1, \mathrm{Naph}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-1.3\left(4 \mathrm{C}, \mathrm{SiCH}_{3}\right), 8.00\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 8.02\left(\mathrm{SiCH}_{2} \mathrm{C}\right)$, $19.3\left(\mathrm{CCH}_{3}\right), 32.6\left(\mathrm{CCH}_{2} \mathrm{C}\right), 106.4(\mathrm{C}-3, \mathrm{Fu}), 110.5(\mathrm{C}-4, \mathrm{Fu}), 135.3$ (C-1, Naph), 135.8 (C-4, Naph), 136.69 ( $C-2$ or $C$-3, Naph ), 136.74 ( $C$-2 or $C$-3, Naph), 141.4 ( $C$-5, Fu), 143.1 (C-4a, Naph), 144.0 (C-8a, Naph), $154.6(C-2, \mathrm{Fu}) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-7.41,-7.38$. Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{26} \mathrm{OSi}_{2}$ : C, 68.73; H, 8.33. Found: C, 68.8; H, 8.3.

Attempted preparation of $\{5-[(3,5,5,8,8-$ pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methyl]-2-furyl $\}$ lithium (94) (representative experiment). A 1.6 M solution of $n$ butyllithium in $n$-hexane ( $300 \mu \mathrm{~L}, 480 \mu \mathrm{~mol}$ of $n$ - BuLi ) was added at $0^{\circ} \mathrm{C}$ to a stirred mixture of 93 ( $140 \mathrm{mg}, 445 \mu \mathrm{~mol}$ ) and diisopropylamine ( $10 \mathrm{mg}, 98.8 \mu \mathrm{~mol}$ ) in THF ( 3 mL ) (change of color from colorless to red). The mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for a further 20 min , followed by quenching with chlorotrimethylsilane ( $86 \mathrm{mg}, 791 \mu \mathrm{~mol}$ ). The result of the subsequent GC/EI MS analysis is shown in Figure 1 (p. 22, Section 5). The result of this reaction sequence did not depend on the mode of addition of the chlorotrimethylsilane (i.e., addition of the chlorotrimethylsilane to the reaction mixture or addition of an aliquot of the reaction mixture to a solution of chlorotrimethylsilane in THF).

5-Bromo-2-furoic acid (95). This compound was commercially available (Aldrich, B6,7406).

Preparation of methyl 5-bromo-2-furoate (96). A mixture of dichloromethane ( 700 mL ), $\mathbf{9 5}$ ( $146 \mathrm{~g}, 764 \mathrm{mmol}$ ), 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU; $122 \mathrm{~g}, 801 \mathrm{mmol}$ ), and iodomethane $(130 \mathrm{~g}, 916 \mathrm{mmol})$ was heated under reflux for 22 h . The mixture was cooled to $20^{\circ} \mathrm{C}$ and was then successively washed with a saturated aqueous ammonium chloride solution (solution A, 300 mL ), a saturated aqueous sodium hydrogen carbonate solution (solution B, 300 mL ), and water (solution C, 300 mL ). The first aqueous wash solution (A) was extracted with ethyl acetate ( 200 mL ), the resulting organic extract was used to extract the second aqueous wash solution (B), the resulting organic extract was used to extract the third aqueous wash solution (C), and the organic extract was separated, followed by a second extraction of the aqueous wash solutions A, B and C with a fresh portion of ethyl acetate ( 200 mL ), using the same protocol as described for the first extraction sequence. The combined organic extracts were dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $10 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 30 \mathrm{~min}$ ). $n$-Hexane ( 1.1 L ) was added to the residue, and the resulting mixture was heated under reflux for 5 min , followed by filtration of the hot mixture. The filter cake was washed with boiling $n$-hexane
$(160 \mathrm{~mL})$, the filtrate and the wash solution were combined, and the resulting solution was cooled to $20{ }^{\circ} \mathrm{C}$ within 2 h and then kept undisturbed at $4^{\circ} \mathrm{C}$ for 2 days (formation of a crystalline precipitate). The precipitate was separated by decantation and recrystallized from boiling $n$-hexane ( 720 mL , crystallization at $4^{\circ} \mathrm{C}$ over a period of 4 days). The product was again isolated by decantation and dried in vacuo ( $0.01 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 112 g of a yellowish crystalline solid. The mother liquors of the crystallization steps were combined and concentrated under reduced pressure to a volume of 250 mL , and a further 17 g of the product were obtained by crystallization, using the same method as described above. Compound 96 was obtained in a total yield of $82 \%$ as a yellowish crystalline solid ( $129 \mathrm{~g}, 629 \mathrm{mmol}$ ); mp $64-65{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 3.87(\mathrm{~s}, 3 \mathrm{H}$, $\left.\mathrm{OCH}_{3}\right), 6.43\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=3.5 \mathrm{~Hz}, 1 \mathrm{H}, H-4, \mathrm{Fu}\right), 7.10\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=3.5 \mathrm{~Hz}, 1 \mathrm{H}, \mathrm{H}-3, \mathrm{Fu}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 52.1\left(\mathrm{OCH}_{3}\right), 113.9(C-4, \mathrm{Fu}), 120.1(C-3, \mathrm{Fu}), 127.5(C-5, \mathrm{Fu}), 146.2(C-2, \mathrm{Fu}), 158.0$ $(C(\mathrm{O}) \mathrm{O})$. Anal. Calcd for $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{BrO}_{3}: \mathrm{C}, 35.15 ; \mathrm{H}, 2.46 ; \mathrm{Br}, 38.98$. Found: C, $35.4 ; \mathrm{H}, 2.7 ; \mathrm{Br}, 38.8$.

Preparation of methyl 5-(but-2-ynyl)-2-furoate (97). A 0.68 M solution of isopropylmagnesium bromide in THF ( $552 \mathrm{~mL}, 375 \mathrm{mmol}$ of $i-\mathrm{PrMgBr}$ ) was added dropwise at -40 ${ }^{\circ} \mathrm{C}\left( \pm 5^{\circ} \mathrm{C}\right.$, temperature measured within the flask) within 110 min to a solution of $96(70.0 \mathrm{~g}, 341$ $\mathrm{mmol})$ in THF ( 1.0 L ). The resulting mixture was stirred at $-40^{\circ} \mathrm{C}\left( \pm 5^{\circ} \mathrm{C}\right)$ for a further 3 h , followed by sequential addition of copper(I) cyanide ( $7.70 \mathrm{~g}, 86.0 \mathrm{mmol}$ ) in one single portion and of 1-bromo-2-butyne ( $64.8 \mathrm{~g}, 487 \mathrm{mmol}$ ) dropwise within 5 min (temperature increase to $-20^{\circ} \mathrm{C}$ ). The mixture was stirred at $-35^{\circ} \mathrm{C}$ for 2 h and kept undisturbed at $-20^{\circ} \mathrm{C}$ for a further 16 h , and the cold $\left(-20^{\circ} \mathrm{C}\right)$ mixture was then added to a cold $\left(0^{\circ} \mathrm{C}\right)$ vigorously stirred emulsion consisting of a saturated aqueous ammonium chloride solution ( 400 mL ) and ethyl acetate ( 200 mL ). The resulting mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 30 min , followed by filtration at the same temperature. The filter cake was washed with ethyl acetate $(2 \times 100 \mathrm{~mL})$, and the two-phase filtrate and the wash solutions were combined. The organic layer was separated, the aqueous phase was extracted with ethyl acetate $(3 \times 100 \mathrm{~mL})$, and the organic extracts were combined and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the residue was purified by bulb-tobulb distillation (Kugelrohr apparatus; first fraction $\left(<100{ }^{\circ} \mathrm{C}, 1.03 \mathrm{~g}\right)$, discarded; second fraction $\left(100-130{ }^{\circ} \mathrm{C}, 51.7 \mathrm{~g}\right)$, crude product). The second fraction (yellowish oil) was crystallized from boiling $n$-hexane ( 265 mL , crystallization at $4^{\circ} \mathrm{C}$ over a period of 4 days), and the crystalline solid was separated by decantation and recrystallized from boiling $n$-hexane ( 190 mL , crystallization at 4 ${ }^{\circ} \mathrm{C}$ over a period of 2 days). The product was again isolated by decantation and dried in vacuo ( 0.01 mbar, $20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 34.2 g of a colorless crystalline solid. The mother liquors of the crystallization steps were combined, the solvent was removed under reduced pressure, and a further 3.4 g of the product were obtained by crystallization of the oily residue using the same method as
described above. Compound 97 was obtained in a total yield of $62 \%$ as a colorless crystalline solid ( $37.6 \mathrm{~g}, 211 \mathrm{mmol}$ ); $\mathrm{mp} 44^{\circ} \mathrm{C} .{ }^{1} \mathrm{H} \operatorname{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 1.81-1.84\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{CCH}_{3}\right), 3.57-3.62(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{CCH}_{2} \mathrm{C}$ ), $3.83\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 6.33-6.36(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-4, \mathrm{Fu}), 7.08-7.11(\mathrm{~m}, 1 \mathrm{H}, \mathrm{H}-3, \mathrm{Fu}) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 3.5\left(\mathrm{CCH}_{3}\right), 19.4\left(\mathrm{CCH}_{2} \mathrm{C}\right), 52.0\left(\mathrm{OCH}_{3}\right), 72.7\left(\mathrm{CH}_{3} \mathrm{C} \equiv \mathrm{CCH}_{2}\right), 78.4\left(\mathrm{CH}_{3} \mathrm{C} \equiv \mathrm{CCH}_{2}\right)$, $108.8(C-4, \mathrm{Fu}), 119.3(C-3, \mathrm{Fu}), 144.0(C-2, \mathrm{Fu}), 156.5(C-5, \mathrm{Fu}), 159.2(C(\mathrm{O}) \mathrm{O})$. Anal. Calcd for $\mathrm{C}_{10} \mathrm{H}_{10} \mathrm{O}_{3}$ : C, 67.41; H, 5.66. Found: C, 67.3; H, 5.7.

Preparation of methyl 5-[(3,5,5,8,8-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)methyl]-2-furoate (98). A solution of cyclopentadienylcobaltdicarbonyl $\left(\mathrm{CpCo}(\mathrm{CO})_{2}\right.$; $1.53 \mathrm{~g}, 8.50 \mathrm{mmol}$ ) in $m$-xylene ( 90 mL ) was added dropwise within 14 h to a boiling solution of $\mathbf{8 4}$ $(10.9 \mathrm{~g}, 56.1 \mathrm{mmol})$ and $\mathbf{9 7}(10.0 \mathrm{~g}, 56.1 \mathrm{mmol})$ in $m$-xylene $(100 \mathrm{~mL})$, followed by addition of $\mathbf{8 4}$ $(5.47 \mathrm{~g}, 28.1 \mathrm{mmol})$ in one single portion at $20^{\circ} \mathrm{C}$ and then by dropwise addition of a solution of $\mathrm{CpCo}(\mathrm{CO})_{2}(1.03 \mathrm{~g}, 5.72 \mathrm{mmol})$ in $m$-xylene $(60 \mathrm{~mL})$ at reflux temperature within 12 h . (To avoid heating of the $\mathrm{CpCo}(\mathrm{CO})_{2}$ solution before its addition, the dropping funnel containing this catalyst was separated from the refluxing reaction mixture by a glass tube (length, 20 cm ), through which the $\mathrm{CpCo}(\mathrm{CO})_{2}$ solution was allowed to drop freely into the refluxing mixture.) The solvent was removed under reduced pressure, and the residue was purified by column chromatography on silica gel (column dimensions, $65 \times 4.5 \mathrm{~cm}$; silica gel ( $15-40 \mu \mathrm{~m}$, Merck 1.15111 ), 425 g ; eluent, ethyl acetate $/ n$-hexane ( $5: 95, \mathrm{v} / \mathrm{v}$ )). The relevant fractions (GC control) were combined, the solvent was removed under reduced pressure, and the residue was dried in vacuo ( $0.01 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) to give 11.1 g of a yellowish oil, which was redissolved in $n$-hexane ( 95 mL ). The resulting solution was kept at $-20^{\circ} \mathrm{C}$ over a period of 7 days (formation of a precipitate), and the precipitate was isolated by decantation, washed with cold $\left(-20^{\circ} \mathrm{C}\right) n$-hexane ( 70 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20$ ${ }^{\circ} \mathrm{C}, 2 \mathrm{~h}$ ) to give 6.83 g of a colorless crystalline solid. The mother liquor was concentrated under reduced pressure to a volume of 25 mL , and a further 1.28 g of the product were obtained by crystallization, using the same method as described above. Compound $\mathbf{9 8}$ was obtained in a total yield of $39 \%$ as a colorless crystalline solid $(8.11 \mathrm{~g}, 21.8 \mathrm{mmol}) ; \mathrm{mp} 75-76{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta$ 0.359 (s, $6 \mathrm{H}, \mathrm{SiCH}_{3}$ ), 0.361 ( $\mathrm{s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}$ ), 1.13 ("s", $4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}$ ), 2.16 (br "s", $3 \mathrm{H}, \mathrm{CCH}_{3}$ ), $3.55\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{OCH}_{3}\right), 3.77$ (br "s", $2 \mathrm{H}, \mathrm{CCH} \mathrm{C}_{2} \mathrm{C}$ ), $5.66\left(\mathrm{dt},{ }^{3} J_{\mathrm{HH}}=3.4 \mathrm{~Hz},{ }^{4} J_{\mathrm{HH}}=1.0 \mathrm{~Hz}, 1 \mathrm{H}, H-4\right.$, Fu), 7.03 ( $\mathrm{d},{ }^{3} J_{\mathrm{HH}}=3.4 \mathrm{~Hz}, 1 \mathrm{H}, H-3, \mathrm{Fu}$ ), 7.42 ( $\mathrm{s}, 1 \mathrm{H}, H-1, \mathrm{Naph}$ ), 7.43 (br "s", $1 \mathrm{H}, H-4, \mathrm{Naph}$ ). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-1.34(2 \mathrm{C}, \mathrm{SiCH}),-1.31(2 \mathrm{C}, \mathrm{SiCH} 3), 7.94\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 7.95\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 19.3$ $\left(\mathrm{CCH}_{3}\right), 32.7\left(\mathrm{CCH}_{2} \mathrm{C}\right), 51.0\left(\mathrm{OCH}_{3}\right), 108.7(\mathrm{C}-4, \mathrm{Fu}), 119.0(\mathrm{C}-3, \mathrm{Fu}), 135.3(\mathrm{C}-1$, Naph $), 135.5$ (C-2, Naph), 135.9 ( $C-4$, Naph ), 136.7 ( $C$-3, Naph), 143.4 ( $C-4 \mathrm{a}, \mathrm{Naph}$ ), 144.1 ( $C-2, \mathrm{Fu}$ ), 144.5 ( $C$ 8a, Naph $)$, $158.9(C(\mathrm{O}) \mathrm{O}), 159.2(C-5, \mathrm{Fu}) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-7.32,-7.28$. Anal. Calcd for $\mathrm{C}_{20} \mathrm{H}_{28} \mathrm{O}_{3} \mathrm{Si}_{2}$ : C, 64.47; H, 7.57. Found: C, 64.2; H, 7.7.

Preparation of $5-[(3,5,5,8,8$-pentamethyl-5,8-disila-5,6,7,8-tetrahydro-2-naphthyl)-methyll-2-furoic acid (99). A mixture of water ( 48 mL ), methanol ( 143 mL ), potassium hydroxide $(6.90 \mathrm{~g}, 123 \mathrm{mmol})$, and $98(4.34 \mathrm{~g}, 11.6 \mathrm{mmol})$ was heated under reflux for 20 min (slow dissolution of $\mathbf{9 8}$ ) and was then stirred at $0{ }^{\circ} \mathrm{C}$ for 1 min , followed by addition of dichloromethane $(50 \mathrm{~mL})$ and 1 M hydrochloric acid to adjust a pH of 1 . The resulting two-phase mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for 5 min and then at $20^{\circ} \mathrm{C}$ for a further 15 min . The organic phase was separated, the aqueous layer was extracted with dichloromethane $(3 \times 50 \mathrm{~mL})$, and the organic extracts were combined and dried over anhydrous sodium sulfate. The solvent was removed under reduced pressure, and the solid residue was dried in vacuo ( $0.01 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 1 \mathrm{~h}$ ) and dissolved in diethyl ether ( 140 mL ). The product was crystallized by vapor diffusion of $n$-pentane into this solution at $20^{\circ} \mathrm{C}$ over a period of 14 days and was isolated by decantation, washed with $n$-pentane ( 20 mL ), and dried in vacuo ( $0.01 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give 3.42 g of a colorless crystalline solid. The solvent of the mother liquor was removed under reduced pressure, the residue was redissolved in diethyl ether ( 30 mL ), and a further 420 mg of the product were obtained by crystallization, using the same method as described above. Compound 99 was obtained in a total yield of $92 \%$ as a colorless crystalline solid ( $3.84 \mathrm{~g}, 10.7 \mathrm{mmol}$ ); mp $171{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 0.36\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.37(\mathrm{~s}, 6$ $\mathrm{H}, \mathrm{SiCH}_{3}$ ), 1.13 ("s", $4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}$ ), $2.14\left(\mathrm{~s}, 3 \mathrm{H}, \mathrm{CCH} H_{3}\right), 3.72\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{CCH}_{2} \mathrm{C}\right), 5.58\left(\mathrm{dt},{ }^{3} J_{\mathrm{HH}}=3.5\right.$ $\left.\mathrm{Hz},{ }^{4} J_{\mathrm{HH}}=0.8 \mathrm{~Hz}, 1 \mathrm{H}, H-4, \mathrm{Fu}\right), 7.04\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=3.5 \mathrm{~Hz}, 1 \mathrm{H}, H-3, \mathrm{Fu}\right), 7.40(\mathrm{~s}, 1 \mathrm{H}, H-1$, Naph), 7.44 (s, $1 \mathrm{H}, H-4$, Naph), 10.1 (br s, $1 \mathrm{H}, \mathrm{CO}(\mathrm{O}) H$ ). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-1.4\left(2 \mathrm{C}, \mathrm{SiCH}_{3}\right),-1.3(2$ C, SiCH 3$), 7.92\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 7.94\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 19.2\left(\mathrm{CCH}_{3}\right), 32.7\left(\mathrm{CCH}_{2} \mathrm{C}\right), 109.1(\mathrm{C}-4, \mathrm{Fu}), 121.5(C-$ 3, Fu), 135.2 ( $C$-2, Naph), 135.3 ( $C-1$, Naph), 135.9 (C-4, Naph), 136.7 ( $C$-3, Naph), 143.1 (C-2, Fu), 143.5 ( C-4a, Naph), 144.6 ( C-8a, Naph), $160.6(C-5, \mathrm{Fu}), 163.9(C(\mathrm{O}) \mathrm{O}) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta$ $-7.30,-7.25$. Preparation of 2,4,6-trimethoxyaniline (101). 12 M Hydrochloric acid ( $84.0 \mathrm{~mL}, 1.01 \mathrm{~mol}$ of HCl ) was added dropwise at $20^{\circ} \mathrm{C}$ within 40 min to potassium permanganate $(12.8 \mathrm{~g}, 81.0$ mmol ) (temperature increase), and the resulting chlorine gas was passed through a stirred solution
of potassium hydroxide ( $50.5 \mathrm{~g}, 900 \mathrm{mmol}$ ) in water $(300 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. After the addition of hydrochloric acid was complete, the residual chlorine gas was passed into the aqueous solution by a nitrogen gas stream for 45 min , followed by addition of $\mathbf{1 0 0} \cdot \mathrm{MeOH}(48.7 \mathrm{~g}, 200 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$ in one single portion. The mixture was stirred at $0{ }^{\circ} \mathrm{C}$ for a further 6 h and then at $20^{\circ} \mathrm{C}$ for 12 h (change of color from colorless to dark brown), followed by addition of sodium sulfite ( $12.7 \mathrm{~g}, 101$ mmol ) at $20^{\circ} \mathrm{C}$ in one single portion. The mixture was stirred at $20^{\circ} \mathrm{C}$ for 15 min , the resulting precipitate was separated by suction filtration, and the filter cake was washed successively with water ( 100 mL ) and diethyl ether ( 200 mL ). The filtrate and the wash solutions were combined, the two-phase mixture was shaken thoroughly, the organic layer was separated, and the aqueous phase was extracted with diethyl ether $(2 \times 200 \mathrm{~mL})$. The combined organic extracts were dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure, and the dark-brown residue was purified by bulb-to-bulb distillation (Kugelrohr apparatus, $110-140{ }^{\circ} \mathrm{C} / 0.1 \mathrm{mbar}$ ) to give 101 in $38 \%$ yield as a colorless liquid ( $13.9 \mathrm{~g}, 75.9 \mathrm{mmol}$ ), which crystallized at $4^{\circ} \mathrm{C}$; mp 29$31{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 3.47\left(\mathrm{~s}, 6 \mathrm{H}, o-\mathrm{OCH}_{3}\right.$, Tri), $3.58\left(\mathrm{~s}, 3 \mathrm{H}, p-\mathrm{OCH}_{3}\right.$, Tri), 3.6 (br s, 2 H , $\left.\mathrm{N} H_{2}\right), 6.32$ ( $\mathrm{s}, 2 \mathrm{H}, H-3 / H-5$, Tri). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 55.3\left(o-\mathrm{OCH}_{3}\right.$, Tri), $55.4\left(p-\mathrm{OCH}_{3}, \operatorname{Tri}\right), 92.1$ ( $C-3 / C-5$, Tri), 120.3 ( $C-1$, Tri), 148.1 ( $C-2 / C-6$, Tri), 152.7 ( $C-4$, Tri). Anal. Calcd for $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{3}$ : C, 59.00; H, 7.15; N, 7.65. Found: C, 58.9; H, 7.1; N, 7.5.

Preparation of $\mathbf{2 , 4 , 6}$-trimethoxyanilinium chloride $\mathbf{( 1 0 1} \cdot \mathbf{H C l})$. A 2 M ethereal hydrogen chloride solution ( $15.5 \mathrm{~mL}, 31.0 \mathrm{mmol}$ of HCl ) was added dropwise at $20^{\circ} \mathrm{C}$ to a stirred solution of $101(5.34 \mathrm{~g}, 29.1 \mathrm{mmol})$ in dichloromethane $(110 \mathrm{~mL})$. The mixture was shaken briefly and then kept undisturbed at $20^{\circ} \mathrm{C}$ for 1 h (formation of a precipitate) and at $4^{\circ} \mathrm{C}$ for a further 16 h . The product was isolated by suction filtration, washed with diethyl ether ( 20 mL ), and dried in vacuo $\left(0.01 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}\right)$ to give $\mathbf{1 0 1} \cdot \mathrm{HCl}$ in $98 \%$ yield as a colorless crystalline solid $(6.28 \mathrm{~g}, 28.6$ mmol); mp 241-242 ${ }^{\circ} \mathrm{C}$ (dec). ${ }^{1} \mathrm{H}$ NMR ( $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta 3.79$ (s, $3 \mathrm{H}, p-\mathrm{OCH} H_{3}$, Tri), 3.85 (s, $6 \mathrm{H}, o-$ $\mathrm{OCH}_{3}$, Tri), 6.38 (s, $2 \mathrm{H}, \mathrm{H}-3 / \mathrm{H}-5$, Tri), 9.6 ( $\mathrm{br} \mathrm{s}, 3 \mathrm{H}, \mathrm{NH} H_{3}$ ). ${ }^{13} \mathrm{C}$ NMR ( $\left[\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta 55.7$ ( $p-$ $\mathrm{OCH}_{3}$, Tri ), $56.4\left(o-\mathrm{OCH}_{3}\right.$, Tri), 91.5 ( $C-3 / C-5$, Tri), 101.4 ( $C-1$, Tri), 153.7 ( $C-2 / C-6$, Tri) , 160.3 (C-4, Tri). Anal. Calcd for $\mathrm{C}_{9} \mathrm{H}_{14} \mathrm{ClNO}_{3}: \mathrm{C}, 49.21 ; \mathrm{H}, 6.42 ; \mathrm{N}, 6.38$. Found: C, 49.2; H, 6.3; N, 6.3.

Preparation of trichloro(2,4,6-trimethoxyphenyl)silane (102). A suspension of 1,3,5trimethoxybenzene $(100 \mathrm{~g}, 595 \mathrm{mmol})$ in a mixture of $n$-hexane $(350 \mathrm{~mL})$ and TMEDA $(71.4 \mathrm{~g}, 614$ mmol ) was heated to ca. $50^{\circ} \mathrm{C}$ to dissolve the 1,3,5-trimethoxybenzene. After the heat source was removed, a 2.5 M solution of $n$-butyllithium in $n$-hexane ( $244 \mathrm{~mL}, 610 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise within 20 min to the vigorously stirred mixture. During the addition, the heat of reaction caused the mixture to boil under reflux, and a white precipitate was formed. After the addition was complete, the mixture was stirred vigorously (to prevent agglomeration) at $20{ }^{\circ} \mathrm{C}$ for 3 days
(formation of (2,4,6-trimethoxyphenyl)lithium), and the resulting suspension was then added via a dropping funnel at $0^{\circ} \mathrm{C}$ within 30 min to a vigorously stirred solution of tetrachlorosilane ( 101 g , $594 \mathrm{mmol})$ in $n$-hexane ( 200 mL ). The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 15 min and then at $20^{\circ} \mathrm{C}$ for 16 h . Diethyl ether ( 700 mL ) was added, the resulting mixture was stirred at $20^{\circ} \mathrm{C}$ for a further 1 h , the precipitate was separated by filtration and washed with diethyl ether ( $3 \times 100 \mathrm{~mL}$ ), and the filtrate and the wash solutions were combined. The solvent was removed under reduced pressure, the residue was dissolved in boiling $n$-heptane ( 1 L ), and the resulting solution was filtered hot. The filtrate was cooled to $20{ }^{\circ} \mathrm{C}$ within 3 h and then kept undisturbed at this temperature for 16 h , and the resulting precipitate was isolated by filtration and recrystallized from boiling $n$-heptane ( 700 mL ; including hot filtration, cooling to $20^{\circ} \mathrm{C}$ within 3 h , and undisturbed storage at $20^{\circ} \mathrm{C}$ for 16 h ). The product was isolated by filtration and dried in vacuo ( $0.001 \mathrm{mbar}, 20$ ${ }^{\circ} \mathrm{C}, 5 \mathrm{~h}$ ) to give $\mathbf{1 0 2}$ in $65 \%$ yield as a colorless crystalline solid ( $116 \mathrm{~g}, 385 \mathrm{mmol}$ ); mp $102{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 3.30\left(\mathrm{~s}, 6 \mathrm{H}, o-\mathrm{OCH}_{3}\right.$ ), $3.33\left(\mathrm{~s}, 3 \mathrm{H}, p-\mathrm{OCH}_{3}\right.$ ), $5.89\left(\mathrm{~s}, 2 \mathrm{H}, H-3 / H-5\right.$, Tri). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 54.8\left(p-\mathrm{OCH}_{3}\right), 55.1\left(o-\mathrm{OCH}_{3}\right), 91.0(C-3 / C-5$, Tri), $98.9(C-1$, Tri), $166.7(C-4$, Tri), 166.8 (C-2/C-6, Tri). ${ }^{29}$ Si NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-6.7$. Anal. Calcd for $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{Cl}_{3} \mathrm{O}_{3} \mathrm{Si}: \mathrm{C}, 35.84 ; \mathrm{H}, 3.68$. Found: C, 36.0; H, 3.7.

Preparation of tris(chloromethyl)(2,4,6-trimethoxyphenyl)silane (103). A 2.5 M solution of $n$-butyllithium in $n$-hexane $(110 \mathrm{~mL}, 275 \mathrm{mmol}$ of $n$ - BuLi$)$ was added dropwise at $-70{ }^{\circ} \mathrm{C}( \pm 3$ ${ }^{\circ} \mathrm{C}$, temperature measurement within the flask) within 4 h to a stirred mixture of $\mathbf{1 0 2}$ (27.2 g, 90.2 mmol ), bromochloromethane ( $52.8 \mathrm{~g}, 408 \mathrm{mmol}$ ), and THF ( 150 mL ) (the $n$-butyllithium solution was added via a special horizontally elongated side neck of the three-necked flask, which itself was immersed in the cooling bath to ensure pre-cooling of the $n$-butyllithium solution before making contact with the reaction mixture). After the addition was complete, the mixture was stirred at -70 ${ }^{\circ} \mathrm{C}$ for 6 h and then warmed to $-25^{\circ} \mathrm{C}$ within 11 h . The cold $\left(-25^{\circ} \mathrm{C}\right)$ mixture was poured into a cold $\left(0^{\circ} \mathrm{C}\right)$ stirred two-phase mixture of half-saturated aqueous sodium hydrogen carbonate solution ( 200 mL , solution A) and ethyl acetate $(100 \mathrm{~mL})$. The resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 5 min , and the organic phase was separated and washed with water ( 200 mL , solution B). The first aqueous wash solution (A) was extracted with ethyl acetate ( 100 mL ), the resulting organic extract was used to extract the second aqueous wash solution (B), and the organic extract was separated, followed by a second and third extraction of the wash solutions A and B with fresh portions of ethyl acetate $(2 \times 100 \mathrm{~mL})$ using the same protocol as described for the first extraction sequence. All organic extracts were combined and dried briefly over anhydrous sodium sulfate, followed by an additional thorough dynamic drying over anhydrous sodium sulfate using a standard chromatographic column densely packed with anhydrous sodium sulfate (column dimensions, 20
$\mathrm{cm} \times 3.5 \mathrm{~cm})$. The sodium sulfate was finally washed with ethyl acetate $(3 \times 300 \mathrm{~mL})$, all organic solutions were combined, the solvent was removed under reduced pressure, and the oily residue ( 30 g) was purified by column chromatography on silica gel (column dimensions, $61 \mathrm{~cm} \times 5.5 \mathrm{~cm}$; silica gel (32-63 $\mu \mathrm{m}, \quad \mathrm{ICN} 02826), 640 \mathrm{~g}$; eluent, $n$-hexane/diethyl ether/1,8-diazabicyclo[5.4.0]undec-7-ene (59:40:1 (v/v/v))). The relevant fractions (GC control) were combined, and the solvent was removed under reduced pressure to give 16 g of a colorless oily product, which was crystallized and then recrystallized twice from boiling $n$-hexane. 200 mL were used for each crystallization step, and the crystallizations were carried out at $4{ }^{\circ} \mathrm{C}$ over a period of 1 day. The precipitate was isolated by filtration and washed with cold $\left(0^{\circ} \mathrm{C}\right) n$-pentane $(40 \mathrm{~mL})$ after each crystallization step, and the product was finally dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 2 \mathrm{~h}$ ) to give $\mathbf{1 0 3}$ in $39 \%$ yield (including workup of the combined mother liquors) as a colorless crystalline solid $(12.1 \mathrm{~g}, 35.2 \mathrm{mmol}) ; \mathrm{mp} 88{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 3.18\left(\mathrm{~s}, 6 \mathrm{H}, o-\mathrm{OCH}_{3}\right), 3.40\left(\mathrm{~s}, 3 \mathrm{H}, p-\mathrm{OCH}_{3}\right)$, $3.50\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{Cl}\right), 5.97$ (s, $2 \mathrm{H}, H-3 / H-5$, Tri). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 26.8\left(\mathrm{SiCH}_{2} \mathrm{Cl}\right), 54.72(p-$ $\left.\mathrm{OCH}_{3}\right), 54.75\left(o-\mathrm{OCH}_{3}\right), 90.9(C-3 / C-5$, Tri), $95.9(C-1$, Tri), $165.4(C-4$, Tri), $167.3(C-2 / C-6$, Tri). ${ }^{29}$ Si NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-7.0$. Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{17} \mathrm{Cl}_{3} \mathrm{O}_{3} \mathrm{Si}: \mathrm{C}, 41.93 ; \mathrm{H}, 4.99 ; \mathrm{Cl}, 30.94$. Found: C, 41.9; H, 5.1; Cl, 31.1.

Preparation of dichlorobis(2,4,6-trimethoxyphenyl)silane (104). A suspension of 1,3,5trimethoxybenzene $(100 \mathrm{~g}, 595 \mathrm{mmol})$ in a mixture of $n$-hexane $(350 \mathrm{~mL})$ and TMEDA $(71.4 \mathrm{~g}, 614$ mmol ) was heated to ca. $50^{\circ} \mathrm{C}$ to dissolve the $1,3,5$-trimethoxybenzene. After the heat source was removed, a 2.5 M solution of $n$-butyllithium in $n$-hexane ( $244 \mathrm{~mL}, 610 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise within 20 min to the vigorously stirred mixture. During the addition, the heat of reaction caused the mixture to boil under reflux, and a white precipitate was formed. After the addition was complete, the mixture was stirred vigorously (to prevent agglomeration) at $20{ }^{\circ} \mathrm{C}$ for 3 days (formation of (2,4,6-trimethoxyphenyl)lithium), and the resulting suspension was then added via a dropping funnel at $0^{\circ} \mathrm{C}$ within 30 min to a vigorously stirred solution of tetrachlorosilane $(50.4 \mathrm{~g}$, $297 \mathrm{mmol})$ in $n$-hexane ( 200 mL ). The mixture was stirred at $0^{\circ} \mathrm{C}$ for a further 1 h (exclusive formation of $\mathbf{1 0 2}$ at this temperature, GC control) and then at $20^{\circ} \mathrm{C}$ for 2 h . Significant warming (no reflux; ca. $50-60^{\circ} \mathrm{C}$ ) was observed at this point (selective formation of $\mathbf{1 0 4}$ and nearly complete conversion $\mathbf{1 0 2} \boldsymbol{\rightarrow \mathbf { 1 0 4 }}$, GC control), followed by cooling to $20^{\circ} \mathrm{C}$ within 1 h and stirring at this temperature for a further 16 h . The solid product was collected by filtration (the filtrate contained tiny amounts of residual $\mathbf{1 0 2}$, but virtually no $\mathbf{1 0 4}$; GC control), the filter cake was dissolved in boiling dichloromethane ( 1 L ) and filtered hot, the resulting filter cake (mainly consisting of lithium salts) was washed with dichloromethane ( 60 mL ), the filtrate and the wash solution were combined, and the solvent was partially removed by distillation at atmospheric pressure until a residual volume
of ca. 600 mL was obtained. The residue was then kept undisturbed at $-25^{\circ} \mathrm{C}$ for seven days. The resulting precipitate was isolated by filtration and recrystallized from boiling dichloromethane (500 mL ; including hot filtration and undisturbed storage at $-25^{\circ} \mathrm{C}$ for seven days), and the product was isolated by filtration at $-25^{\circ} \mathrm{C}$, washed with cold $\left(-25^{\circ} \mathrm{C}\right)$ dichloromethane $(100 \mathrm{~mL})$, and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 5 \mathrm{~h}$ ) to give 104 in $67 \%$ yield (including workup of the mother liquor) as a colorless crystalline solid $(85.6 \mathrm{~g}, 198 \mathrm{mmol}) ; \mathrm{mp} 156-157{ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 3.66(\mathrm{~s}, 12$ $\left.\mathrm{H}, o-\mathrm{OCH}_{3}\right), 3.81\left(\mathrm{~s}, 6 \mathrm{H}, p-\mathrm{OCH}_{3}\right), 6.09\left(\mathrm{~s}, 4 \mathrm{H}, H-3 / H-5\right.$, Tri). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta 55.6(p-$ $\left.\mathrm{OCH}_{3}\right), 56.0\left(o-\mathrm{OCH}_{3}\right), 91.4(C-3 / C-5$, Tri), $104.3(C-1$, Tri), $164.9(C-4$, Tri), $166.1(C-2 / C-6$, Tri). ${ }^{29}$ Si NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-5.9$. Anal. Calcd for $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{Cl}_{2} \mathrm{O}_{6} \mathrm{Si}$ : C, $49.89 ; \mathrm{H}, 5.12 ; \mathrm{Cl}, 16.36$. Found: C, 49.5; H, 5.2; Cl, 16.6.

Treatment of 104 with (chloromethyl)lithium (attempted preparation of bis(chloromethyl)bis(2,4,6-trimethoxyphenyl)silane (105)). A suspension of $\mathbf{1 0 4}$ (26.8 g, 61.8 $\mathrm{mmol})$ in a mixture of THF $(150 \mathrm{~mL})$ and bromochloromethane $(23.9 \mathrm{~g}, 185 \mathrm{mmol})$ was heated under reflux for 5 min to dissolve 104. The vigorously stirred mixture was cooled slowly to $-78{ }^{\circ} \mathrm{C}$ (precipitation of $\mathbf{1 0 4}$ was observed at a temperature of ca. $20^{\circ} \mathrm{C}$ and below). A 2.5 M solution of $n$ butyllithium in $n$-hexane ( $52.0 \mathrm{~mL}, 130 \mathrm{mmol}$ of $n$ - BuLi ) was added dropwise at $-70^{\circ} \mathrm{C}\left( \pm 3{ }^{\circ} \mathrm{C}\right.$, temperature measurement within the flask) within 3 h to the stirred mixture (the $n$-butyllithium solution was added via a special horizontally elongated side neck of the three-necked flask, which itself was immersed in the cooling bath to ensure pre-cooling of the $n$-butyllithium solution before making contact with the reaction mixture). After the addition was complete, the mixture was stirred at $-70^{\circ} \mathrm{C}$ for 6 h and then warmed to $0^{\circ} \mathrm{C}$ within 15 h . Reaction control (GC) revealed that the starting material $\mathbf{1 0 4}$ had remained untouched (no further workup). ${ }^{99}$

Preparation of (4-bromobuty)chlorodimethylsilane (106). This compound was prepared analogous to the preparation of (6-bromohexyl)chlorodimethylsilane (108) (see below) from 4-bromobut-1-ene ( $25.0 \mathrm{~g}, 185 \mathrm{mmol}$ ) and chlorodimethylsilane ( $29 \mathrm{~g}, 307 \mathrm{mmol})^{100}$ in $70 \%$ yield $(29.9 \mathrm{~g}, 130 \mathrm{mmol})$ (related to 4-bromobut-1-ene); bp $88{ }^{\circ} \mathrm{C} / 9 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.40(\mathrm{~s}, 6$ $\left.\mathrm{H}, \mathrm{SiCH}_{3}\right), 0.76-0.86\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Br}\right), 1.49-1.62\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Br}\right), 1.84-$ $1.95\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Br}\right), 3.40\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=6.7 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2} \mathrm{Br}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.6\left(\mathrm{SiCH}_{3}\right), 18.0\left(\mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Br}\right), 21.6\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Br}\right), 33.2\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2} \mathrm{Br}\right)$, $35.5\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Br}\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 31.9$. Preparation of (5-bromopentyl)chlorodimethylsilane (107). This compound was prepared analogous to the preparation of (6-bromohexyl)chlorodimethylsilane (108) (see below) from 5-bromopent-1-ene $(25.1 \mathrm{~g}, 168 \mathrm{mmol})$ and chlorodimethylsilane $(27.8 \mathrm{~g}, 294 \mathrm{mmol})^{100}$ in $77 \%$ yield
(related to 5-bromopent-1-ene) as a colorless liquid ( $31.5 \mathrm{~g}, 129 \mathrm{mmol}$ ); bp $92-93{ }^{\circ} \mathrm{C} / 2 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$ ): $\delta 0.38\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.75-0.86\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{Br}\right), 1.34-1.53(\mathrm{~m}, 4 \mathrm{H}$, $\left.\mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Br}\right), 1.78-1.90\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Br}\right), 3.37\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=6.8 \mathrm{~Hz}, 2 \mathrm{H}\right.$, $\left.\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{Br}\right) . \quad{ }^{13} \mathrm{C} \quad \mathrm{NMR} \quad\left(\mathrm{CDCl}_{3}\right): \quad \delta \quad 1.6 \quad\left(\mathrm{SiCH}_{3}\right), \quad 18.7 \quad\left(\mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{Br}\right), \quad 22.2$ $\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Br}\right), \quad 31.3 \quad\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Br}\right), \quad 32.3 \quad\left(\mathrm{Si}_{( }\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Br}\right), \quad 33.7$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{Br}\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ 32.0. Anal. Calcd for $\mathrm{C}_{7} \mathrm{H}_{16} \mathrm{BrClSi}: \mathrm{C}, 34.51 ; \mathrm{H}, 6.62$ Found: C, 34.1; H, 6.4.

Preparation of (6-bromohexyl)chlorodimethylsilane (108). $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}(5 \mathrm{mg}, 9.7 \mu \mathrm{~mol})$ was added at $20^{\circ} \mathrm{C}$ to a solution of chlorodimethylsilane ( $19.1 \mathrm{~g}, 202 \mathrm{mmol}$ ) and 6-bromohex-1-ene $(27.4 \mathrm{~g}, 168 \mathrm{mmol})$ in toluene $(200 \mathrm{~mL})$, and the mixture was heated immediately in a pre-heated oil bath $\left(140{ }^{\circ} \mathrm{C}\right)$. After the reaction had started, the oil bath was removed. As soon as the reaction started to become less vigorous, the mixture was heated under reflux (no drop in temperature below reflux temperature at any time), and further portions of $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ and chlorodimethylsilane were added sequentially: first portion (after 30 min ), addition of $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}(5 \mathrm{mg}, 9.7 \mu \mathrm{~mol}$; dissolved in propan-2-ol $(50 \mu \mathrm{~L})$ ), followed by addition of chlorodimethylsilane ( $5.00 \mathrm{~g}, 52.8$ mmol ); second to fifth portion (after $40,50,60$, and 70 min ), $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}(5 \mathrm{mg}, 9.7 \mu \mathrm{~mol}$; dissolved in propan-2-ol $(50 \mu \mathrm{~L})$ ) and chlorodimethylsilane ( $1.00 \mathrm{~g}, 10.6 \mathrm{mmol}$ ). After addition of the last portion, the mixture was heated under reflux for a further 50 min . The solvent was removed by distillation under normal pressure, and the residue was distilled in vacuo (Vigreux column, 30 cm ) to give $\mathbf{1 0 8}$ in $83 \%$ yield (related to 6-bromohex-1-ene) as a colorless liquid ( $35.8 \mathrm{~g}, 139$ mmol ); bp $100-101{ }^{\circ} \mathrm{C} / 3 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.38\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right), 0.74-0.84(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{Br}\right), \quad 1.28-1.49 \quad\left(\mathrm{~m}, \quad 6 \quad \mathrm{H}, \quad \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{3}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Br}\right), \quad 1.77-1.89 \quad(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Br}\right), 3.38\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=6.8 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{2} \mathrm{Br}\right) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 1.6$ $\left(\mathrm{SiCH}_{3}\right), 18.8\left(\mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{Br}\right), 22.8\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{Br}\right), 27.7\left(\mathrm{Si}_{\left.\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Br}\right), 32.0}\right.$ $\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Br}\right), 32.6\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Br}\right), 33.9\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{2} \mathrm{Br}\right) .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta$ 32.1. Preparation of (6-bromohexyl)dimethylsilane (111). Compound 108 ( $34.9 \mathrm{~g}, 135 \mathrm{mmol}$ ) was added at $20^{\circ} \mathrm{C}$ within a period of 5 min to a stirred suspension of LAH ( $3.74 \mathrm{~g}, 98.5 \mathrm{mmol}$ ) in diethyl ether $(250 \mathrm{~mL})$, causing the mixture to boil under reflux during the addition. The resulting mixture was heated under reflux for 30 min , cooled to $20^{\circ} \mathrm{C}$, and then added dropwise to a stirred mixture of concentrated hydrochloric acid ( 100 mL ), diethyl ether ( 200 mL ), and ice ( 200 g ) (to avoid ignition, this step was also performed under a nitrogen atmosphere). The organic layer was separated, the aqueous phase was extracted with diethyl ether ( $3 \times 100 \mathrm{~mL}$ ), and the combined organic extracts were dried over anhydrous magnesium sulfate in an ice bath, followed by additional thorough dynamic drying over anhydrous magnesium sulfate using a standard chromatographic column densely packed with anhydrous magnesium sulfate (column dimensions, $15 \times 3.5 \mathrm{~cm})$. The magnesium sulfate was finally washed with diethyl ether ( 300 mL ), the organic solutions were combined, the solvent was removed under reduced pressure, and the residue was distilled in vacuo (Vigreux column, 30 cm ) to give 111 in $91 \%$ yield as a colorless liquid ( 27.6 g , 124 mmol ); bp $80^{\circ} \mathrm{C} / 3 \mathrm{mbar}$. Preparation of $\boldsymbol{N}$-allylsuccinimide (115). Preparation analogous to the synthesis of $\mathbf{1 1 3}$ from succinic acid anhydride ( $15.0 \mathrm{~g}, 150 \mathrm{mmol}$ ) and allylamine ( $8.56 \mathrm{~g}, 150 \mathrm{mmol}$ ) in toluene ( 100 mL ). The solvent was removed under reduced pressure, and the residue was distilled in vacuo (Vigreux column, 8 cm ) to give $\mathbf{1 1 5}$ in $85 \%$ yield as a colorless liquid ( $17.8 \mathrm{~g}, 128 \mathrm{mmol}$ ); bp $73{ }^{\circ} \mathrm{C} / 0.08$ mbar. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 2.68\left(\mathrm{~s}, 4 \mathrm{H}, \mathrm{C}(\mathrm{O}) \mathrm{CH}_{2}\right), 4.06\left(\delta_{\mathrm{M}}\right), 5.13\left(\delta_{\mathrm{A}}\right), 5.17\left(\delta_{\mathrm{B}}\right)$, and $5.74\left(\delta_{\mathrm{G}}\right)$ $\left({ }^{2} J_{\mathrm{AB}}=1.2 \mathrm{~Hz},{ }^{3} J_{\mathrm{AG}, \mathrm{cis}}=10.2 \mathrm{~Hz},{ }^{4} J_{\mathrm{AM}}=1.2 \mathrm{~Hz},{ }^{3} J_{\mathrm{BG}, \text { trans }}=17.1 \mathrm{~Hz},{ }^{4} J_{\mathrm{BM}}=1.4 \mathrm{~Hz},{ }^{3} J_{\mathrm{GM}}=5.9 \mathrm{~Hz}\right.$, $\left.5 \mathrm{H}, \mathrm{N}\left(\mathrm{C}\left(H_{\mathrm{M}}\right)_{2}\right) \mathrm{CH}_{\mathrm{G}}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right) .{ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 28.1\left(\mathrm{C}(\mathrm{O}) \mathrm{CH}_{2}\right), 40.8\left(\mathrm{NCH}_{2} \mathrm{C}\right), 118.3$ $\left(\mathrm{NCH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 130.6\left(\mathrm{NCH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 176.7(\mathrm{C}=\mathrm{O})$. Anal. Calcd for $\mathrm{C}_{7} \mathrm{H}_{9} \mathrm{NO}_{2}: \mathrm{C}, 60.42 ; \mathrm{H}$, 6.52 ; N, 10.07. Found: C, 60.5; H, 6.5; N, 10.2.

Preparation of N -(2-methylallyl)phthalimide (116). A mixture of $N, N$-dimethylformamide $(200 \mathrm{~mL})$, potassium phthalimide $(46.3 \mathrm{~g}, 250 \mathrm{mmol})$, and 2-methylallyl chloride ( $22.6 \mathrm{~g}, 250$ mmol ) was heated under reflux for 16 h . The mixture was cooled to $20^{\circ} \mathrm{C}$, followed by addition of ice (ca. 100 g ) and water ( 500 mL ), and the resulting mixture was extracted with toluene ( $4 \times 100$ mL ). The organic extracts were combined and dried over anhydrous magnesium sulfate, the solvent was removed under reduced pressure, and the solid residue was recrystallized from methanol (400 $\mathrm{mL})$ at $-25^{\circ} \mathrm{C}$ over a period of 1 day. The product was isolated by filtration and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 8 \mathrm{~h}$ ) to give $\mathbf{1 1 6}$ in $80 \%$ yield as a colorless crystalline solid ( $40.0 \mathrm{~g}, 199$ $\mathrm{mmol}) ; \mathrm{mp} 88-89^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 1.74-1.77\left(\mathrm{~m}, 3 \mathrm{H}, \mathrm{CCH}_{3}\right), 4.18-4.21\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{NCH}_{2} \mathrm{C}\right)$, 4.77-4.81 (m, $\left.1 \mathrm{H}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 4.85-4.88\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{C}=\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right), 7.66-7.74$ (m, $2 \mathrm{H}, \mathrm{H}-4 / H-5$, Phth), 7.80-7.88 (m, $2 \mathrm{H}, \mathrm{H}-3 / \mathrm{H}-6$, Phth). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 20.4\left(\mathrm{CCH}_{3}\right), 43.2\left(\mathrm{NCH}_{2} \mathrm{C}\right), 111.9$ $\left(\mathrm{NCH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 123.3$ ( $C-3 / C-6$, Phth), 132.0 ( $C-1 / C-2$, Phth), 134.0 ( $C-4 / C-5$, Phth), 139.3 $\left(\mathrm{NCH}_{2} \mathrm{C}\left(\mathrm{CH}_{3}\right)=\mathrm{CH}_{2}\right), 168.0(\mathrm{C}=\mathrm{O})$. Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{11} \mathrm{NO}_{2}: \mathrm{C}, 71.63 ; \mathrm{H}, 5.51 ; \mathrm{N}, 6.96$. Found: C, 71.5; H, 5.6; N, 7.0.

Preparation of the ( $\omega$-bromoalkyl)(3-imidopropyl)dimethylsilanes 117-126 and rac-127. Protocol A. $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ (catalytic, as solid or dissolved in propan-2-ol) was added at $20{ }^{\circ} \mathrm{C}$ to a solution of the ( $\omega$-bromoalkyl)dimethylsilane and the $N$-allylimide in toluene, and the mixture was
heated immediately in a pre-heated oil bath $\left(140^{\circ} \mathrm{C}\right)$ for 30 min , followed by addition of another portion of $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ (catalytic, dissolved in propan-2-ol) ${ }^{102}$ and heating under reflux for a further 1 h (complete disappearance of the $\mathrm{Si}-\mathrm{H}$ IR absorption band at $2110-2113 \mathrm{~cm}^{-1}$; measured as a film of the reaction mixture). The reaction mixture was filtered over silica gel using a standard chromatographic column (column diameter, 3.5 cm ; silica gel (63-200 $\mu \mathrm{m}$; Fluka 60741), 30 g ). The silica gel was then washed with ethyl acetate ( 500 mL ), and the organic solutions were combined. The solvent was removed under reduced pressure, and the product was finally purified by column chromatography on silica gel using diethyl ether $/ n$-hexane (the appropriate mixture was chosen according to TLC analysis in order to achieve an $R_{\mathrm{f}}$ value of ca. 0.5 ) as the eluent. The relevant fractions (TLC, GC) were combined, and the solvent was removed under reduced pressure. After bulb-to-bulb-distillation in vacuo, the desired ( $\omega$-bromoalkyl)(3-imidopropyl)dimethylsilane was obtained as an NMR-spectroscopically pure colorless viscous liquid. Protocol B. The success of this method is based on the complete conversion of the $N$-allylimide, which frequently was found to be difficult to separate from the product by bulb-to-bulb distillation without preceeding separation by column chromatography. Use of an excess of the ( $\omega$-bromoalkyl)dimethylsilane (usually approx. 1.02-1.05 molar equivalents related to the $N$-allylimide) ensured complete conversion of the $N$-allylimide when this method was used similar to the protocol described in Protocol A, followed by the same workup as described; i.e., the reaction mixture was filtered over silica gel using a standard chromatographic column (column diameter, 3.5 cm ; silica gel (63-200 $\mu \mathrm{m}$; Fluka 60741 ), 30 g ). The silica gel was then washed with ethyl acetate ( 500 mL ), and the organic solutions were combined. The solvent was removed under reduced pressure, and the product was finally purified by bulb-to-bulb distillation in vacuo (no column chromatography) to give the desired ( $\omega$-bromoalkyl)(3-imidopropyl)dimethylsilane as an NMR-spectroscopically pure colorless or yellowish viscous liquid.

Preparation of (4-bromobutyl)dimethyl[3-(1,8-naphthalimido)propyl]silane (117). Compound $\mathbf{1 1 7}$ was prepared according to Protocol B ( $\mathbf{1 0 9}$ ( 3.98 g, 20.4 mmol ); $\mathbf{1 1 2}$ ( $4.75 \mathrm{~g}, 20.0$ mmol ); toluene ( 50 mL ); $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}(20 \mathrm{mg}, 38.6 \mu \mathrm{~mol})$ (first portion, solid); $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}(10$ $\mathrm{mg}, 19.3 \mu \mathrm{~mol}$ ) (second portion, dissolved in propan-2-ol ( $50 \mu \mathrm{~L}$ ); added after 30 min )). After bulb-to-bulb-distillation ( $210-240{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$ ), compound 117 was obtained in $84 \%$ yield (related to 109) as a yellowish viscous liquid ( $7.41 \mathrm{~g}, 17.1 \mathrm{mmol}$ ). ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta-0.05\left(\mathrm{~s}, 6 \mathrm{H}, \mathrm{SiCH}_{3}\right)$, $0.42-0.52\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{Br}\right), 0.54-0.65\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 1.32-1.46(\mathrm{~m}, 2 \mathrm{H}$, $\mathrm{SiCH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Br}$ ), 1.61-1.75 (m, $2 \mathrm{H}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}$ ), 1.81 ("quint", ${ }^{3} J_{\mathrm{HH}}=6.9 \mathrm{~Hz}, 2 \mathrm{H}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Br}\right), 3.35\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=6.9 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{2} \mathrm{Br}\right), 4.05-4.14(\mathrm{~m}, 2 \mathrm{H}$, $\left.\mathrm{NCH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{Si}\right), 7.68\left(\mathrm{dd},{ }^{3} J_{\mathrm{HH}}=8.3 \mathrm{~Hz},{ }^{3} J_{\mathrm{HH}}=7.3 \mathrm{~Hz}, 2 \mathrm{H}, H-3 / H-6\right.$, Naphth), 8.14 (dd, ${ }^{3} J_{\mathrm{HH}}=8.3$

Preparation of rac-N,N,2-trimethylpropane-1,3-diamine (rac-134). A solution of rac-133 $(73.7 \mathrm{~g}, 657 \mathrm{mmol})$ in diethyl ether $(250 \mathrm{~mL})$ was added dropwise within 70 min to a stirred suspension of LAH ( $13.7 \mathrm{~g}, 361 \mathrm{mmol}$ ) in diethyl ether ( 300 mL ), causing the solvent to boil under reflux during the addition. After the addition was complete, the mixture was heated under reflux for 1 h and then cooled to $0^{\circ} \mathrm{C}$, followed by cautious addition of water ( 150 mL ) (formation of a precipitate). The two-phase mixture was filtered, the filter cake was washed with diethyl ether ( $3 \times$ 50 mL ), the two-phase filtrate and the wash solutions were combined, ethane-1,2-diamine ( 150 mL ) was added, and the resulting two-phase mixture was extracted continuously for 2 days using a perforator. The organic phase was dried over anhydrous potassium carbonate, the solvent was removed under reduced pressure, and the residue was distilled under atmospheric pressure to give 62 g of a yellow liquid; bp $110-150^{\circ} \mathrm{C}$. Redistillation using a spinning band column gave rac-134 in $28 \%$ yield as a colorless liquid ( $21.5 \mathrm{~g}, 185 \mathrm{mmol}$ ); bp $140-141^{\circ} \mathrm{C} / 981 \mathrm{mbar}$ (significant decomposition was observed during the distillation). ${ }^{104}{ }^{1} \mathrm{H} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 0.84\left(\delta_{\mathrm{X}}\right), 1.57\left(\delta_{\mathrm{G}}\right)$,

Preparation of 1-chloro-1-(chloromethyl)-1-silacyclohexane (136). 50 mL of a solution of 1,5-dibromopentane ( $161 \mathrm{~g}, 700 \mathrm{mmol}$ ) in diethyl ether ( 500 mL ) were added to a stirred suspension of magnesium turnings ( $37.4 \mathrm{~g}, 1.54 \mathrm{~mol}$ ) in diethyl ether $(200 \mathrm{~mL})$, and the reaction was started by gentle heating. Subsequently, the remaining ethereal 1,5 -dibromopentane solution was added within 90 min , causing the mixture to boil under reflux. After the addition was complete, the mixture was heated under reflux for a further 90 min and then cooled to $20^{\circ} \mathrm{C}$ within 1 h . The resulting two-phase Grignard reagent (which was separated from residual magnesium turnings by decantation, followed by washing of the magnesium with diethyl ether $(2 \times 50 \mathrm{~mL})$ ) was added dropwise within 90 min to a solution of trichloro(chloromethyl)silane ( $129 \mathrm{~g}, 701 \mathrm{mmol}$ ) in diethyl ether ( 300 mL ), causing the mixture to boil under reflux. During the addition, the mixture was stirred vigorously with a mechanical stirrer (formation of a precipitate). After the addition was complete, the mixture was stirred at $20^{\circ} \mathrm{C}$ for 16 h , the precipitate was separated by filtration and washed with diethyl ether $(2 \times 200 \mathrm{~mL})$, the filtrate and the wash solutions were combined, and the solvent was removed by distillation under atmospheric pressure, causing a postprecipitation. The
precipitate was separated by decantation and washed with $n$-pentane $(2 \times 50 \mathrm{~mL})$, and all organic solutions were combined. The solvent was removed as described above, and the crude product (79 g) was isolated by distillation in vacuo (Vigreux column, 30 cm ; bp $80-95^{\circ} \mathrm{C} / 18 \mathrm{mbar}$ ) and then further purified by redistillation to afford 136 in $52 \%$ yield (related to 1,5 -dibromopentane) as a colorless liquid ( $67.4 \mathrm{~g}, 368 \mathrm{mmol}$ ); bp $88-90{ }^{\circ} \mathrm{C} / 18 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.92-1.12(\mathrm{~m}, 4 \mathrm{H}$, $\mathrm{SiCH}_{2} \mathrm{C}$ ), 1.21-1.37, 1.56-1.79, and 1.81-1.95 (m, $\left.6 \mathrm{H}, \mathrm{SiCH}_{2}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{C}\right), 2.98$ (s, $2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{Cl}$ ). ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 13.4\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 23.3\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 28.9\left(\mathrm{Si}_{\left.\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 29.0\left(\mathrm{SiCH}_{2} \mathrm{Cl}\right) .}\right.$ ${ }^{29}$ Si NMR $\left(\mathrm{CDCl}_{3}\right): \delta 20.8$. Anal. Calc. for $\mathrm{C}_{6} \mathrm{H}_{12} \mathrm{Cl}_{2} \mathrm{Si}: \mathrm{C}, 39.35 ; \mathrm{H}, 6.60$. Found: C, 39.0; H, 6.3.

Preparation of benzyl 2-[1-(chloromethyl)-1-sila-1-cyclohexyl]acetate (137). A 2.5 M solution of $n$-butyllithium in $n$-hexane ( $45.6 \mathrm{~mL}, 114 \mathrm{mmol}$ of $n$-BuLi) was added dropwise ${ }^{107}$ at 0 ${ }^{\circ} \mathrm{C}$ within 10 min to a stirred (mechanical stirrer) solution of diisopropylamine ( $12.5 \mathrm{~g}, 124 \mathrm{mmol}$ ) in THF ( 100 mL ), and the mixture was stirred at the same temperature for a further 15 min and then cooled to $-80^{\circ} \mathrm{C}$, followed by dropwise addition of benzyl acetate ( $17.2 \mathrm{~g}, 115 \mathrm{mmol}$ ) within 15 min while the reaction temperature was kept at $-75^{\circ} \mathrm{C}\left( \pm 5^{\circ} \mathrm{C}\right)$. The mixture was stirred at this temperature for a further 15 min , followed by dropwise addition of 1,3-dimethyl-3,4,5,6-tetrahydropyrimidin-2 $(1 \mathrm{H})$-one (DMPU) $(58.5 \mathrm{~g}, 456 \mathrm{mmol})$ at $-75^{\circ} \mathrm{C}\left( \pm{ }^{\circ} \mathrm{C}\right)$ within 30 min (formation of a slurry), and the mixture was then cooled to $-100^{\circ} \mathrm{C}$, followed by dropwise addition of $\mathbf{1 3 6}(20.8 \mathrm{~g}, 114 \mathrm{mmol})$ within 75 min while the temperature was kept at $-95{ }^{\circ} \mathrm{C}\left( \pm 5{ }^{\circ} \mathrm{C}\right)$ (formation of a highly viscous slurry). The mixture was warmed to $-30^{\circ} \mathrm{C}$ within 4 h (formation of a clear solution), and the cold solution was poured into a stirred two-phase mixture of a saturated aqueous sodium hydrogen carbonate solution ( 300 mL , solution A) and diethyl ether ( 200 mL ) (formation of a precipitate which remained in the aqueous phase). The organic phase was separated and washed with a saturated aqueous sodium hydrogen carbonate solution ( 300 mL , solution B), the organic phase was separated, the first aqueous wash solution (A) was extracted with diethyl ether $(200 \mathrm{~mL})$, the resulting ethereal extract was used to extract the second aqueous wash solution (B), and the organic extract was separated, followed by a second extraction of the wash solutions A and B with a fresh portion of diethyl ether ( 200 mL ), using the same protocol as described for the first extraction sequence. The combined organic solutions were dried over anhydrous sodium sulfate, the solvent was removed under reduced pressure, and the oily residue was purified by rapid bulb-tobulb distillation in vacuo (Kugelrohr apparatus). The distillate ( $33 \mathrm{~g}, 140-155^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}$ ) was redistilled in vacuo (Vigreux column, 10 cm ) to give 137 in $43 \%$ yield as a colorless liquid ( 14.4 g , $48.5 \mathrm{mmol})$; bp $137-138{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right): \delta 0.65-0.87\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}\right), 1.32-$ 1.43 (m, $2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}$ ), 1.56-1.74 (m, $4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}$ ), 2.10 ( $\mathrm{s}, 2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}(\mathrm{O})$ ), 2.86 ( s , $2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{Cl}$ ), $5.07\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{OCH}_{2} \mathrm{Ph}\right), 7.26-7.38\left(\mathrm{~m}, 5 \mathrm{H}, \mathrm{C}_{6} H_{5}\right) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}\right): \delta 9.7$

Preparation of tert-butyl 2-\{1-[((tert-butoxycarbonyl)amino)methyl]-1-sila-1cyclohexyl\}acetate (144). A solution of $143(802 \mathrm{mg}, 2.98 \mathrm{mmol})$ in tert-butanol ( 5 mL ) was heated under reflux for 1 day. The solvent was removed under reduced pressure, and the residue was purified by bulb-to-bulb distillation in vacuo (Kugelrohr apparatus). The fraction collected at $110-130{ }^{\circ} \mathrm{C} / 0.001 \mathrm{mbar}(717 \mathrm{mg})$ was crystallized from diethyl ether ( 25 mL ) at $-27^{\circ} \mathrm{C}$ over a period of 3 days. The product was isolated by filtration, washed with cold $\left(-27^{\circ} \mathrm{C}\right) n$-pentane ( 5 mL ), and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 4 \mathrm{~h}$ ) to give $\mathbf{1 4 4}$ in $44 \%$ yield as a colorless crystalline solid ( $450 \mathrm{mg}, 1.31 \mathrm{mmol}$ ); mp 84-85 ${ }^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 0.64-0.74\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{SiCH} \mathrm{C}_{2} \mathrm{C}\right), 1.27-$ $1.39\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 1.50\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{CCH}_{3}\right), 1.59\left(\mathrm{~s}, 9 \mathrm{H}, \mathrm{CCH}_{3}\right), 1.61-1.73(\mathrm{~m}, 4 \mathrm{H}$, $\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}$ ), $1.90\left(\mathrm{~s}, 2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{C}(\mathrm{O})\right.$ ), $2.96\left(\mathrm{~d},{ }^{3} J_{\mathrm{HH}}=5.4 \mathrm{~Hz}, 2 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{~N}\right), 5.1(\mathrm{br} \mathrm{s}, 1 \mathrm{H}, \mathrm{N} H)$. ${ }^{13} \mathrm{C}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta 10.5\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 23.7\left(\mathrm{SiCH}_{2} \mathrm{C}(\mathrm{O})\right), 24.2\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 27.9\left(\mathrm{SiCH}_{2} \mathrm{~N}\right), 28.2$ $\left(\mathrm{CCH}_{3}\right), 28.5\left(\mathrm{CCH}_{3}\right), 29.7\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 78.4\left(\mathrm{CCH}_{3}\right), 79.9\left(\mathrm{CCH}_{3}\right), 156.8(\mathrm{NC}(=\mathrm{O}) \mathrm{O}), 171.9$ $(\mathrm{CC}(=\mathrm{O}) \mathrm{O}) .{ }^{15} \mathrm{~N}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-310.4 .{ }^{29} \mathrm{Si}$ NMR $\left(\mathrm{C}_{6} \mathrm{D}_{6}\right): \delta-3.0$. Anal. Calcd for $\mathrm{C}_{17} \mathrm{H}_{33} \mathrm{NO}_{4} \mathrm{Si}:$ C, 59.44; H, 9.68; N, 4.08. Found: C, 59.5; H, 9.5; N, 4.1.

Preparation of $1,1^{\prime}$-oxybis $\{[(1-$ sila-1-cyclohexyl)methyl]ammonium\} dichloride (145). A solution of $\mathbf{1 4 0}(720 \mathrm{mg}, 2.67 \mathrm{mmol})$ in toluene ( 5 mL ) was added at $20^{\circ} \mathrm{C}$ in one single portion to a solution of triphenylphosphine ( $722 \mathrm{mg}, 2.75 \mathrm{mmol}$ ) in toluene $(5 \mathrm{~mL})$, and the mixture was
stirred at $20^{\circ} \mathrm{C}$ for 1 day. The solvent was removed under reduced pressure, 6 M hydrochloric acid $(20 \mathrm{~mL})$ was added to the residue, and the mixture was then heated under reflux for $2 \mathrm{~h},{ }^{108}$ cooled to $20^{\circ} \mathrm{C}$, and washed with dichloromethane $(2 \times 10 \mathrm{~mL})$ to remove any triphenylphosphine oxide formed. The aqueous phase was kept undisturbed at $-20^{\circ} \mathrm{C}$ for 2 days, and the resulting precipitate was isolated by filtration and recrystallized from 6 M hydrochloric acid at $-20^{\circ} \mathrm{C}$ over a period of 2 days. The product was isolated by filtration and dried in vacuo ( $0.001 \mathrm{mbar}, 20^{\circ} \mathrm{C}, 8 \mathrm{~h}$ ) to give $\mathbf{1 4 5}$ in $38 \%$ yield (including workup of the mother liquor) as a colorless crystalline solid ( $177 \mathrm{mg}, 512$ $\mu \mathrm{mol}$ ); mp 256-257 ${ }^{\circ} \mathrm{C}$ (dec.). ${ }^{1} \mathrm{H}$ NMR ([D $\left.\mathrm{D}_{6}\right] \mathrm{DMSO}$ ): $\delta 0.62-0.78$ and $0.82-0.96$ (m, 8 H , $\mathrm{SiCH}_{2} \mathrm{C}$ ), $1.25-1.46\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right), 1.49-1.76\left(\mathrm{~m}, 8 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 2.29\left(\mathrm{q},{ }^{3} J_{\mathrm{HH}}=5.9\right.$ $\mathrm{Hz}, 4 \mathrm{H}, \mathrm{SiCH}_{2} \mathrm{~N}$ ), 8.1 (br s, $6 \mathrm{H}, \mathrm{NH}_{3}$ ). ${ }^{13} \mathrm{C} \mathrm{NMR}\left(\left[\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta 13.7\left(\mathrm{SiCH}_{2} \mathrm{C}\right), 23.7$ $\left(\mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{C}\right), 25.5\left(\mathrm{SiCH}_{2} \mathrm{~N}\right), 28.8\left(\mathrm{Si}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{2} \mathrm{C}\right) .{ }^{29} \mathrm{Si}$ NMR ( $\left.\left.\mathrm{D}_{6}\right] \mathrm{DMSO}\right): \delta 0.7$. Anal. Calcd for $\mathrm{C}_{12} \mathrm{H}_{30} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{OSi}_{2}$ : C, $41.72 ; \mathrm{H}, 8.75 ; \mathrm{N}, 8.11$. Found: C, $41.4 ; \mathrm{H}, 8.3 ; \mathrm{N}, 8.0$.

1,1'-(Oxybis-1-silacyclobutane-1,1-diyl)bis(2,4,6-trimethoxybenzene) (146). The mother liquor of the crystallization of compound 74 was evaporated slowly under ambient conditions (humid air, $20^{\circ} \mathrm{C}$ ), upon which a few crystals formed at the surface of the liquid phase. These crystals were suitable for single-crystal X-ray diffraction analysis; however, the crystals of $\mathbf{1 4 6}$ crystallized as a conglomerate with crystals of compound 74. Therefore, the crystal structure analysis of $\mathbf{1 4 6}$ (cf. Section 11.18, p. 58) was successful, but no further characterization (mp, NMR) was obtained from this mixture.

## 16 Appendix B: data of the biological studies

Table 44. In vitro efficacy ( $\mathrm{IC}_{50}$ values) of compounds rac-12a, rac-12b, rac-13, and rac-15 regarding serotonin, noradrenaline, and dopamine reuptake inhibition (preliminary data).

|  |  | $\mathrm{IC}_{50}\left(\mathrm{pIC}_{50}\right)$ |  |
| :---: | :---: | :---: | :---: |
| Compd No. | Noradrenaline | Serotonin | Dopamine |
| $r a c-\mathbf{1 2 a}$ | $281(6.55)$ | $19.6(7.71)$ | $4430(5.35)$ |
| $r a c-\mathbf{1 2 b}$ | $109(6.96)$ | $525(6.28)$ | $2630(5.58)$ |
| $r a c-\mathbf{1 3}$ | $275(6.56)$ | $904(6.04)$ | $707(6.15)$ |
| $r a c-\mathbf{1 5}$ | $2720(5.57)$ | $6480(5.19)$ | $20200(4.69)$ |

$\mathrm{IC}_{50}$ denotes the half-maximum effect concentration [ nM ]. The data represent the mean of duplicate analyses. The $\mathrm{pIC}_{50}$ $\left(=-\log \mathrm{IC}_{50}\right)$ values given in parentheses are the basis for Figure 2 (Section 9.1, p. 35).

Table 45. Compilation of the parameters to characterize the interaction of the allosteric test compounds W84 (11) and 10, 27-30, 32, 33, 35, 36, 39, 42, 45-50, rac-51, rac-52, and $\mathbf{5 3}^{a}$ with $\left[{ }^{3} \mathrm{H}\right]$ NMS-occupied and unoccupied muscarinic $\mathrm{M}_{2}$ receptors.

${ }^{a}$ Tested as the hydrochloride $\mathbf{5 3} \cdot \mathrm{HCl}$. ${ }^{b}$ The order of the test compounds compiled in Table 45 reflects the order as shown in Chart $3 .{ }^{c} \mathrm{pEC}_{50 \text {, diss }}$ indicates the $-\log$ concentration of the test compound at which orthosteric radioligand dissociation was reduced to $50 \%$ compared with control conditions and reflects the affinity of the modulator to NMSoccupied $\mathrm{M}_{2}$ receptors. ${ }^{d}$ Significantly different from $-1 .{ }^{e} \mathrm{p} K_{\mathrm{A}}$ is the $-\log$ value of the equilibrium dissociation constant of the test compound and reflects its affinity for free receptors. Mean values $\pm$ S.E.M., $n=2-6$ independent experiments. ${ }^{f}$ p $\alpha$ is the $-\log$ factor of cooperativity between $\left[{ }^{3} \mathrm{H}\right]$ NMS and the test compound; a positive sign indicates an enhancement of $\left.{ }^{3} \mathrm{H}\right]$ NMS equilibrium binding by the modulator (positive cooperativity), whereas a negative sign denotes a reduction of [ $\left.{ }^{3} \mathrm{H}\right]$ NMS equilibrium binding (negative cooperativity).

## 17 Appendix C: formula index

Hydrochlorides, hydrobromides, and solvates are not reported in this section. The depicted structures refer exclusively to the formulas of the analogous respective free amine bases or of the solvate-free compounds.

Commun. 1989, 19, 2441-2448. (f) Kuwajima, I.; Nakamura, E.; Hashimoto, K. In Organic Syntheses, Coll. Vol. 7; Feeman, J. P., Ed.; John Wiley \& Sons Inc.: New York, USA, 1990; pp. 512-517.
(48) The Experimental Section gives a representative experiment in all cases, which not necessarily reflects the largest scale of the respective reaction that was run within this work.
(49) $\mathrm{Ph}_{3} \mathrm{P} \cdot \mathrm{HBr}$ is a mild, stable, and precisely weighable source of HBr , which is important with respect to the acid-sensitive $\mathrm{Si-OH}$ moiety of $(R) \mathbf{- 1 2 b}$. To the most recent knowledge, the use of $\mathrm{Ph}_{3} \mathrm{P} \cdot \mathrm{HBr}$ for the preparation of ammonium bromides from amines has hitherto not been reported.
(50) Compounds $\mathbf{7 0}$ and $\mathbf{7 1}$ have been reported in the literature, see: (a) Jones, D. A.; Owen, W. J. (Inventors), Midland Silicones Ltd. Ger. Offen. 2053384 (27.05.1971); Chem. Abstr. 1971, 75, 63956k. (b) Matsumoto, K.; Aoki, Y.; Oshima, K.; Utimoto, K.; Rahman, N. A. Tetrahedron 1993, 49, 8487-8502.
(51) The outcome of this reaction hardly depended on the reaction temperature in a range of -78 to $20{ }^{\circ} \mathrm{C}$. See the Experimental Section for a representative experiment. The mode of addition was the addition of a solution of $\mathbf{5 8}$ to a solution of $\mathbf{7 0}, \mathbf{7 1}$, or $\mathbf{7 2}$.
(52) Assuming that $\mathbf{5 8}$ is formed quantitatively in the course of the Shapiro reaction $\mathbf{5 7} \boldsymbol{\mathbf { 5 8 }}$.
(53) Surprisingly, this Grignard reagent did not react with 1,1-dichloro-1-silacyclohexane in refluxing diethyl ether (analogous reaction conditions, GC control).
(54) It is very likely that acetic acid is the active catalyst in this reaction, formed by reaction of acetic acid anhydride with the solvent methanol giving acetic acid and methyl acetate. Hence, the advantage of using acetic acid anhydride in this reaction instead of acetic acid is the fact that the use of the anhydride ensures the absence of any water.
(55) Vollhardt, K. P. C. Angew. Chem. 1984, 96, 525-541; Angew. Chem. Int. Ed. Engl. 1984, 23, 539-556.
(56) Kirner, W. R. J. Am. Chem. Soc. 1928, 50, 1955-1961.
(57) The result of this silylation/GC/EI MS analysis sequence did not depend on the way of addition of the chlorotrimethylsilane, i.e., addition of chlorotrimethylsilane to the reaction mixture or addition of the reaction mixture to a solution of chlorotrimethylsilane in the respective solvents.
(58) The methods for the preparation of $\mathbf{2 2 b}$ using the halogen/metal exchange of $\mathbf{9 6}$ with isopropylmagnesium bromide and using thionyl chloride in the final step (Scheme 11) were
developed by Amedis Pharmaceuticals Ltd., Cambridge, U.K., using the information on the Vollhardt-cyclization gained in the course of this work; cf. Scheme 10 (p. 21, section 5). The methods developed by Amedis Pharmaceuticals Ltd. were optimized in this work and additional methods for the preparation of 22b (starting from $\mathbf{9 9}$ and using DCC or starting from 98 and using trimethylaluminum) were developed in this work; cf. Scheme 11 (p. 23, section 5).
(59) Both the use of THF as the solvent and performing the reaction at low temperature are essential for the successful use of $\mathrm{BrCH}_{2} \mathrm{Cl} / n$ - BuLi as a chloromethylation reagent. ${ }^{33}$
(60) Compounds 10, 29, and 30 were prepared within the experimental work of the Diplomarbeit ${ }^{13 a}$ using the same methods in the last step, but a different strategy for the preparation of the earlier steps of their synthesis. The respective preparation protocols were published in ref. 13b. The pharmacological, experimental, and NMR data of 10, 29, and 30 are given in the respective sections for comparison and completeness.
(61) Although the imido moiety has seniority over the amino functionality in the nomenclature of these compounds, the use of the amine nomenclature produces analogous names in the course of the following step of the synthesis and thus follows the recommendations of IUPAC, Commission on Nomenclature of Organic Chemistry. A Guide to IUPAC Nomenclature of Organic Compounds (Recommendations 1993), 1993, Blackwell Scientific publications, Oxford.
(62) After chromatographic purification, compound $\mathbf{5 3}$ was isolated in ca. $60 \%$ yield as a highly viscous, yellowish oil, which contained some residual ethyl acetate (ca. $5 \%$ by weight) that could not be removed in vacuo.
(63) Nametkin, N. S.; Vdovin, V. M.; Pushchevaya, K. S.; Egorochkin, A. N. Izv. Akad. Nauk SSSR, Ser. Khim. 1967, 2530; Chem. Abstr. 1968, 69, 59325n.
(64) When a mixture of $\mathrm{Cl}_{3} \mathrm{SiCH}_{2} \mathrm{Cl}$ and $\mathrm{Cl}_{2}(\mathrm{Me}) \mathrm{SiCH}_{2} \mathrm{Cl}$ (approx. 70:30 (aceotropic mixture)) was used for the preparation of 136, pure $\mathbf{1 3 6}$ was obtained after distillation with a spinning band column. This represents a cost-effective way for the preparation of $\mathbf{1 3 6}$.
(65) Treatment of $\mathbf{1 3 8}$ with $\mathrm{Pd} / \mathrm{C}$ (dried in vacuo prior to use) in a hydrogen atmosphere ( 3 bar ) for 16 h in methanol or THF afforded toluene and benzyl acetate as the main products (preparative HPLC purification of a representative sample). The presence of the latter compound clearly indicates that $\mathrm{Si}-\mathrm{C}$ bond cleavage took place under these reaction conditions. Additionally, the ${ }^{29} \mathrm{Si}$ NMR spectrum of the mixture (after filtration and evaporation of the solvent in vacuo) showed several peaks.
(66) The data for compounds $\mathbf{1 0}, \mathbf{1 1}, \mathbf{2 7}, \mathbf{2 9}, \mathbf{3 0}, \mathbf{3 2}$, and $\mathbf{3 5}$ were taken from Duda-Johner, S. Dissertation, Universität Bonn, 2002; the data for compounds 28, 33, 36, 39, 42, 45-50, rac51, and rac-52 were taken from Albrecht, M. Dissertation, Universität Bonn, in preparation.
(67) Further investigations are necessary to elucidate the effect of the most interesting test compounds of this series on the binding of $\left[{ }^{3} \mathrm{H}\right] \mathrm{NMS}$ and acetylcholine to muscarinic receptor subtypes. For investigations of muscarinic receptor subtype profiles of 27, 30, 32, and $\mathbf{3 5}$ using $\left[{ }^{3} \mathrm{H}\right]$ NMS, see ref. 43.

(78) Interestingly, the melting point of a sample of 22b that had been crystallized from diethyl ether at 4 to $-20^{\circ} \mathrm{C}$ was $139^{\circ} \mathrm{C}$ (see Experimental section). A finely ground $1: 1(\mathrm{w} / \mathrm{w})$ mixture of the modifications of $\mathbf{2 2 b}$ melting at $139{ }^{\circ} \mathrm{C}$ and $158{ }^{\circ} \mathrm{C}$ showed melting of half of the material at $139{ }^{\circ} \mathrm{C}$ (heating rate $1^{\circ} \mathrm{C} \mathrm{min}^{-1}$ ), followed by recrystallization of all of the molten material at $140-142{ }^{\circ} \mathrm{C}$ (heating rate $1^{\circ} \mathrm{C} \mathrm{min}^{-1}$ ) and, finally, a very sharp melting point of all of the material at $157.6-157.9^{\circ} \mathrm{C}$ (heating rate $0.5^{\circ} \mathrm{C} \mathrm{min}^{-1}$ ).
(79) All attempts to characterize 22a by single-crystal X-ray diffraction failed, but very similar conformations of the 3,5,5,8,8-pentamethyl-5,6,7,8-tetrahydro-2-naphthyl group of 21a and 22a can be expected.
(80) Rademacher, P. Strukturen organischer Moleküle; VCH Verlagsgesellschaft: Weinheim, Germany, 1987; p 56.
(81) The single crystals of $\mathbf{1 4 6}$ were obtained as a conglomerate with crystals of compound $\mathbf{7 4}$. Therefore, the crystal structure analysis of $\mathbf{1 4 6}$ was performed successfully, but no further characterization (mp, NMR) was obtained from this conglomerate.
(82) The moisture-sensitive hydrochloride $r a c-\mathbf{1 8} \cdot \mathrm{HCl}$ was prepared and stored under nitrogen.
(83) (a) Program WIN-DAISY 4.05, Bruker-Franzen GmbH, Bremen, Germany, 1998. (b) Weber, U.; Germanus, A.; Thiele, H. Fresenius J. Anal. Chem. 1997, 359, 46-49.
(84) The ${ }^{1} \mathrm{H}$ NMR data of $r a c-\mathbf{1 2 b} \cdot \mathrm{HCl},(R) \mathbf{- 1 2 b} \cdot \mathrm{HCl},(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl},(R) \mathbf{- 1 2 b} \cdot \mathrm{HBr}, r a c-\mathbf{1 3} \cdot \mathrm{HCl}$, and rac-15. HCl depend significantly on the concentration of these compounds, especially for the $\mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{NH}_{\mathrm{G}}\left(\mathrm{C}\left(\mathrm{H}_{\mathrm{M}}\right)_{3}\left(\mathrm{C}\left(\mathrm{H}_{\mathrm{N}}\right)_{3}\right)\right.$ moiety. The data given were obtained at a concentration of 80 mM . The ${ }^{3} J_{\mathrm{AG}}$ and ${ }^{3} J_{\mathrm{BG}}$ couplings are not resolved, but recognizable by line broadening of the signals for the $\mathrm{CH}_{A} \mathrm{H}_{\mathrm{B}} \mathrm{N}$ protons.
(85) The ${ }^{1} \mathrm{H}$ NMR spectra of $(R)-\mathbf{1 2 b} \cdot \mathrm{HCl}$ and $(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ differ slightly from the ${ }^{1} \mathrm{H}$ NMR spectrum of rac-12b $\cdot \mathrm{HCl}$ in the $\mathrm{SiCH}_{\mathrm{C}} \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{NH}_{\mathrm{G}}\left(\mathrm{C}\left(\mathrm{H}_{\mathrm{M}}\right)_{3}\right)\left(\mathrm{C}\left(\mathrm{H}_{\mathrm{N}}\right)_{3}\right)$ region. This could be explained by the existence of different aggregates in solution $((R) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$ and $(S) \mathbf{- 1 2 b} \cdot \mathrm{HCl}$, exclusively $(R, R)$ - or ( $(S, S)$-aggregates; rac-12b $\cdot \mathrm{HCl},(R, R)$-, $(S, S)$-, and $(R, S)$-aggregates).
(86) As significant disiloxane formation was observed at $22{ }^{\circ} \mathrm{C}$ in $\mathrm{CDCl}_{3}$, the NMR spectra of rac- $\mathbf{1 3}$ were recorded at $-20^{\circ} \mathrm{C}$.
(87) (a) The ${ }^{1} \mathrm{H}$ NMR spectrum showed minor impurities at $\delta 2.72$ (s) and 3.06-3.14 (m), which could not be removed by fractional crystallization. (b) The ${ }^{13} \mathrm{C}$ NMR spectrum showed minor impurities at $\delta 23.3,42.1$, and 54.2 , which could not be removed by fractional crystallization.
(88) (a) The ${ }^{1} \mathrm{H}$ NMR spectrum showed minor impurities at $\delta 0.98\left(\mathrm{~d}, J_{\mathrm{HH}}=6.6 \mathrm{~Hz}, 1 \mathrm{H}\right), 2.22-$ $2.40(\mathrm{~m})$, and $2.78\left(\mathrm{dd}, J_{\mathrm{HH}}=20.8 \mathrm{~Hz}, J_{\mathrm{HH}}=4.0 \mathrm{~Hz}\right)$, which could not be removed by fractional crystallization. (b) The ${ }^{13} \mathrm{C}$ NMR spectrum showed minor impurities at $\delta 15.8$, $28.9,40.9,41.8,43.4,59.8,123.05,131.5$, and 134.40 , which could not be removed by fractional crystallization.
(89) Absence of dichloromethane as the solvent of crystallization was verified by recording a ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{5 3} \cdot \mathrm{HCl}$ in $\left[\mathrm{D}_{6}\right]$ DMSO. However, due to the poor solubility of $\mathbf{5 3} \cdot \mathrm{HCl}$ in $\left[\mathrm{D}_{6}\right]$ DMSO, this solvent was not suitable for recording ${ }^{13} \mathrm{C},{ }^{15} \mathrm{~N}$, and ${ }^{29} \mathrm{Si}$ NMR spectra of this compound.
(90) For a similar method, see: West, R. J. Am. Chem. Soc. 1954, 76, 6012-6014.
(91) This procedure follows a general protocol described in: Chamberlin, A. R.; Stemke, J. E.; Bond, F. T. J. Org. Chem. 1978, 43, 147-154 (there referred to as Method A). In this context, see also: Yu, W.-Y.; Bensimon, C.; Alper, H. Chem. Eur. J. 1997, 3, 417-423.
(92) Significant decomposition of $\mathbf{5 7}$ was observed in $\mathrm{CDCl}_{3}$ at $20^{\circ} \mathrm{C}$.
(93) Diethyl(methyl)amine was used for the preparation of $\mathbf{7 0}$ instead of triethylamine since the latter is hard to separate from the product by distillation. In addition, the precipitate of $\mathrm{Et}_{2} \mathrm{NMe} \cdot \mathrm{HCl}$, which is formed during the reaction, is much less voluminous than the corresponding salt $\mathrm{Et}_{3} \mathrm{~N} \cdot \mathrm{HCl}$ and therefore can be separated much easier by filtration.
(94) As 74 does not dissolve in $n$-hexane at ambient temperature, heating is required.
(95) Attempts to separate $\mathbf{8 1}$ and $\mathbf{8 2}$ by distillation were unsuccessful. However, the identities of $\mathbf{8 1}$ and $\mathbf{8 2}$ could be established unequivocally by comparing the GC-MS data of the mixture with those of authentic samples.
(96) The 1,2-bis(chlorodimethylsilyl)ethane (83) obtained from the Wacker-Chemie GmbH did not contain the isomer 1,1-bis(chlorodimethylsilyl)ethane in detectable amounts (GC).
(97) Kusumoto, T.; Hiyama, T. Chem. Lett. 1988, 1149-1152.
(98) Effenberger, F.; Gleiter, R.; Heider, L.; Niess, R. Chem. Ber. 1968, 101, 502-511.
(99) A representative sample of the precipitated solids was dissolved in dichloromethane and analyzed by GC to ensure that the desired product $\mathbf{1 0 5}$ had not formed and then precipitated quantitatively.
(100) This amount includes the portions of chlorodimethylsilane which were added after 30 (5.00 $\mathrm{g})$ and after $40,50,60$, and $70 \mathrm{~min}(4 \times 1.00 \mathrm{~g})$; cf. the preparation protocol for $\mathbf{1 0 8}$.
(101) Care should be taken during the distillation of compound $\mathbf{1 0 9}$, and the acidic aqueous workup described in the protocol should never be omitted. A violent explosion occurred when the excess lithium aluminum hydride and other precipitates were removed after the reaction by centrifugation (no acidic aqueous workup), followed by removing the solvent under reduced pressure and subsequent distillation.
(102) Using solid $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ as the first portion has the advantage that only a tiny amount of the catalyst dissolves in the reaction mixture. This helps to keep the reaction under control, which, in some cases, can be very vigorous, especially when done at larger scales. In certain cases, more (cf. preparation of rac-127) or fewer portions (cf. preparation of 118) may be necessary, depending on the nature of the starting materials and on the reaction scales; the exact amount of $\mathrm{H}_{2} \mathrm{PtCl}_{6} \cdot 6 \mathrm{H}_{2} \mathrm{O}$ used is given in the respective preparation protocols.
(103) Compound 129 was prepared within the experimental work of the Diplomarbeit. ${ }^{13 a}$ The experimental and NMR data are given for comparison and completeness.
(104) The distillation could not be performed under reduced pressure owing to excessive foaming.
(105) After the solvent was removed under reduced pressure, the salt $\mathbf{1 3 5} \cdot \mathrm{CH}_{3} \mathrm{C}(\mathrm{O}) \mathrm{OH}$ was obtained. During the subsequent bulb-to-bulb distillation, dissociation of this salt occurred, and acetic acid was collected at $<150^{\circ} \mathrm{C} / 0.05 \mathrm{mbar}$ as a lower-boiling fraction in a cooled trap.
(106) Attempts to recrystallize the NMR-spectroscopically almost pure product from various organic solvents (ethyl acetate, dichloromethane, propan-2-ol) failed due to the instability of $\mathbf{1 3 5}$ in solution. Meanwhile, compound $\mathbf{1 3 5}$ has been described in the literature, stating that it can be recrystallized successfully from a mixture of dichloromethane and hexane; see Jones, G., II; Kumar, S. J. Photochem. Photobiol. A: Chemistry 2003, 160, 139-149.
(107) The same dropping funnel was used for the addition of this and of all the following reagents and was flushed with THF ( 10 mL ) after the addition of each reagent, thus diluting the reagent mixture by a small extent.
(108) Under milder reaction conditions $\left(20^{\circ} \mathrm{C}\right)$, the same product was obtained, but it was formed at a much slower rate.

## Danksagung

An erster Stelle danke ich Herrn Prof. Dr. Reinhold Tacke für den gewährten akademischen Freiraum - vor allem dafür, daß ich aktiv auf die Auswahl der Themen Einfluß nehmen konnte. Ebenso ermöglichte mir Herr Tacke, an einer Reihe herausragender internationaler Fachtagungen teilzunehmen und unterstützte mich bei meinem Antrag für das Stipendium des Fonds der Chemischen Industrie in hervorragender Weise. Hierfür vielen Dank!

Herrn Prof. Dr. Klaus Mohr, Frau Dr. Seraina Duda-Johner und Herrn Marc Albrecht (Pharmakologie und Toxikologie, Pharmazeutisches Institut, Universität Bonn) danke ich für die Untersuchung der allosteren Modulatoren und für die gute und äußerst fruchtbare Kooperation.

Herrn Dr. Rüdiger Bertermann, Herrn Dr. R. Ingo Richter, Herrn Oliver Seiler und Frau Marie-Luise Schäfer danke ich für zahlreiche NMR-Experimente, für die Beantwortung meiner Fragen zur NMR-Meßtechnik und für das zeitintensive Plotten unzähliger Korrelationsspektren.

Herrn Dr. Stephan A. Wagner, Herrn Dr. Thomas Schmid und Frau Dr. Vera I. Handmann danke ich für das Messen zahlreicher Massenspektren. Die schnelle Analytik der Proben - dies gilt selbstverständlich auch für die oben erwähnten NMR-Experimente - machten eine gezielte und effektive Steuerung der Arbeit möglich. Vielen Dank!

Herrn Dr. Christian Burschka und Herrn Martin Penka möchte ich für die Durchführung der zahlreichen Kristallstrukturanalysen und für die Unterstützung bei der Auswertung der Daten danken.

Herrn Claus-Peter Kneis und Frau Richhilde Schedl gilt mein Dank für die Durchführung der Elementaranalysen. Vor allem bei besonderen Problemstellungen, wie etwa begrenzter Haltbarkeit der Proben, war mir ihre Unterstützung eine große Hilfe.

Die vorliegende Arbeit hätte auch ohne handwerkliche Unterstützung nicht durchgeführt werden können. So danke ich Herrn Berthold Fertig für das Anfertigen zahlreicher spezieller Glasgeräte und für schnelle Reparaturen. Herrn Manfred Reinhart, Herrn Wolfgang Obert und Herrn Alois Ruf danke ich für die Wartung der Geräte und Einrichtungen.

Am Entstehen dieser Arbeit waren unsere Laboranten Herr Frank Möller, Herr Lothar Richter und Frau Sabine Scheckenbach, die Auszubildenden Frau Veronika Duchnik, Frau Beate E. Wende, Herr Frank Meyer und Frau Nesrin Toptan und meine F-Praktikanten Frau Daniela Otto und Herr Karsten Klemm beteiligt, deren Ergebnisse in die vorliegende Arbeit einflossen. Ich danke ihnen allen für ihre tatkräftige Unterstützung und für konstruktive Diskussionen.

Unseren Sekretärinnen Frau Loretta Tietze, Frau Silke Estenfelder und Frau Irmgard Pross danke ich für die Unterstützung in allen Verwaltungsangelegenheiten.

Herrn Matthias Büttner danke ich für die aufmerksame Durchsicht dieser Arbeit sowie Matthias und Oli für die super Arbeitsatmosphäre, die in unserer Labornachbarschaft herrscht. Selbiges gilt für den gesamten Arbeitskreis und alle Kollegen, die mich während der Jahre begleitet haben. Allen vielen Dank!

Mein Dank für die Einweisung an den Chromatographiegeräten gilt Herrn Rolf Janiak - vor allem für das Beibringen aller Tips und Tricks, die man in keinem Lehrbuch findet!

Vor allem danke ich meinen Eltern für die Unterstützung während meines Studiums.
Schließen möchte ich meine Danksagung mit besonderem Dank an zwei Menschen, die mir in meiner Würzburger Zeit ganz besonders ans Herz gewachsen sind - Kathrin Karle und Esther Münch. Nicht nur dann, wenn es mal nicht so läuft, sind wir füreinander da. Wir haben jede Menge Spaß zusammen - und werden das in Zukunft auch weiterhin haben!!! Für alles vielen Dank.

Diese Arbeit wurde finanziell unterstützt vom Fonds der Chemischen Industrie und der Firma Amedis Pharmaceuticals Ltd., Cambridge, U.K.

## Erklärung

Hiermit erkläre ich an Eides statt, daß ich die Dissertation

## Synthesis of Sila-Analogs and Silicon-Containing Derivatives of Drugs and Development and Application of the Si-2,4,6-Trimethoxyphenyl Moiety as a Novel Protecting Group in Organosilicon Chemistry

selbständig angefertigt und keine anderen als die von mir angegebenen Quellen und Hilfsmittel benutzt habe.

Ich erkläre außerdem, daß diese Dissertation weder in gleicher oder anderer Form bereits in einem anderen Prüfungsverfahren vorgelegen hat.

Ich habe früher außer den mit dem Zulassungsgesuch urkundlich vorgelegten Graden keine weiteren akademischen Grade erworben oder zu erwerben versucht.

Würzburg, den
