

### III-3

Outcrop photograph showing the Krone Member at the Karoo-Etendeka unconformity. Fine grained sandstones of the Tsarabis Formation developed autobrecciation, alveolar-texture and typical soil colours (marble texture) in a 30 cm thick zone below the unconformity. Erosional features are missing. The exposure is located at the southern slope of an isolated ridge east of the housings on Krone 721 Farm (S20°30'20/E14°01'32'').
