1 Introduction – hypotheses on coexistence	1
2 Host-plant range and host-plant selection	3
2.1. Introduction	3
2.2. Material and Methods	4
2.2.1. Study site and study system	4
2.2.2. Host plant use in the field	7
2.2.3. Choice tests	8
2.2.4. Secondary chemistry	8
2.2.5. Larval development on different Convolvulaceae-species	8
2.3. Results	9
2.3.1. Host plant use	9
2.3.2. Choice tests between different host plant species	11
2.3.3. Plant secondary chemistry of three host plant species	13
2.3.4. Larval development on different plant species	13
2.4. Discussion	14
2.4.1. Host plant range and niche overlap in the field	14
2.4.2. Host plant preferences in choice tests in the laboratory	15
2.4.3. Is the host plant choice of the beetle species adaptive?	17
3 Time - Seasonal phenology of the beetle species and resource availability	19
3.1. Introduction	19
3.2. Methods	20
3.2.1. Abundance and species composition during the season	20
3.2.2. Leaf damage analysis	21
3.2.3. Resource availability: Plant abundance	21
3.2.4. Resource availability: leaf age classes and leaf chemistry	21
3.3. Results	22
3.3.1. Seasonality	22
3.3.2. Phenology of the beetle species	23
3.3.4. Resource use and limiting resources: leaf damage analysis	29
3.3.5. Resource availability over the season	29
3.4. Discussion	34
3.4.1. Seasonality	34
3.4.2. Availability and quality of the host plants and seasonal phenology of the beetles	35

3.4.3. Stochastic events during the season	36
3.4.4. Food as a limiting resource?	37
4 Space - local species composition	39
4.1. Introduction	39
4.2. Material and methods	40
4.2.1. Spatial distribution of the beetle community between sites	40
4.2.2. Spatial distribution of single species within a site	42
4.3. Results	43
4.3.1. Spatial distribution of the beetle community	43
4.3.2. Spatial distribution within sites	46
4.4. Discussion	46
4.4.1. Predictability of the species composition	46
4.4.2. Correlation of the species composition with habitat parameters	47
4.4.3. Habitat parameters responsible for the distribution within one site	48
5 Space - Small scale distribution in the field	50
5.1. Introduction	50
5.2. Material and methods	52
5.2.1. Sun- and shade microhabitats	52
5.2.2. Influence of microclimate and plant quality on larval development	54
5.2.3. Preference of leaf sides in three species	55
5.2.4. Statistics	56
5.3. Results	56
5.3.1. Within habitat distribution: Sun- and shade microhabitats	56
5.3.1.1. Microhabitat use in the field	56
5.3.1.2. Host plant use in different microhabitats at different times	61
5.3.1.3. Plant quality in sun and shade microhabitats	63
5.3.1.4. Microclimate in sun and shade habitats	66
5.3.1.5. Effect of microclimate and plant quality on larval development	69
5.3.2. Within plant distribution: Preference of leaf sides	73
5.4. Discussion	75
5.4.1. Within habitat distribution	75
5.4.1.1. Beetle distribution, niche breadth and overlap in microhabitat use	75
5.4.1.2. Plant quality and microclimate	77
5.4.1.3. Interactive effects of plant quality and microclimate	79
5.4.2. Within plant distribution: preference of leaf side	81

6 Space - Influence of temperature and humidity on larval development; Measures of larval development as adult female fitness correlates?	83
6.1. Introduction	83
6.2. Material and methods	85
6.2.1. Larval development at two different temperatures and humidities	85
6.2.2. Duration of development and weight of pupae as fitness correlates	86
6.2.3. Statistics	86
6.3. Results	87
6.3.1. Larval development at different temperatures and humidities	87
6.3.2. Measures of larval development and fitness of adult females	91
6.3.2.1. Life table parameters of four beetle species	91
6.3.2.2. Duration of development and pupal weight as fitness correlates	92
6.4. Discussion	97
6.4.1. Larval development at different temperatures and humidities	97
6.4.2. Larval development and adult female reproductive success	99
7 Effect of habitat and predator exclusion on larval parasitism and predation	101
7.1. Introduction	101
7.2. Materials and methods	102
7.2.1. Study sites, host plants and beetle species	102
7.2.2. Predation and parasitism experiments	103
7.2.3. Larval mortality of <i>A. roseomarginata</i> under differing predator exclusion	104
7.2.4. Egg parasitism of <i>A. roseomarginata</i>	104
7.2.5. Statistics	105
7.3. Results	105
7.3.1. Predation and parasitism in different habitats	105
7.3.2. Larval mortality during development	109
7.3.3. Mortality of <i>A. roseomarginata</i> -larvae under predator exclusion	111
7.3.4. Mortality of <i>A. roseomarginata</i> -eggs by egg parasitoids	111
7.4. Discussion	112
7.4.1. Mortality and parasitism in different habitats	112
7.4.2. Interspecific comparison of mortality and parasitism	114
7.4.3. Mortality during development	115
7.4.4. Quantitative analyses of mortality factors of <i>A. roseomarginata</i>	116
8 Phylogenetic relationships and evolution of host plant use	118
8.1. Introduction	118
8.2. Materials and methods	121
8.2.1. Beetle sampling	121
8.2.2. DNA extraction, PCR and nucleotide sequencing	121

8.2.3. Sequence alignment	122
8.2.4. Tree-Building methods	123
8.2.5. Outgroups and rooting	123
8.3. Results	123
8.3.1. The combined molecular phylogenetic tree	123
8.3.2. Comparison of the molecular with the morphological tree	125
8.3.3. Comparison of the molecular tree with the ecological cladogram	126
8.3.4. Evolution of host plant use within the beetle community	126
8.4. Discussion	127
8.4.1. Molecular and morphological-systematic phylogenetic tree	127
8.4.2. Molecular and ecological cladogram	127
8.4.3. Evolution of host plant use	128
9 General discussion	130
10 Summary	136
11 References	142
12 Appendix: Photos	152
