

Fig. 8. Photomicrographs of immunofluorescence of coronal sections at the level of the lumbar part of spinal cord of adult mice under the confocal laser scanning microscope (50 X). Respectively, the sections were immunostained with specific antibodies against A-Raf, B-Raf and c-Raf-1 protein kinases (A,D,G). Controls were performed by preadsorption of the three antibodies (B,E,H) with immunizing peptides. Another control was performed by incubation of the sections with 10% normal goat serum alone (C,F,I). For all sections shown, Cy3 fluorochrome-labelled secondary antibody was used for visualization.
